Will say a prayer for a safe journey. I really don't think anyone will
notice he on the wrong, at least not in the Chicago area. :^)

Ok Thanks! I did recieve some email from someone on this group that was able
to point me to a website that does carry the meter. I will probably order
one from them. I do appericate the response though!

Thanks!

Hillbilly_1943 wrote:
>
> yep,   the 250 is the most bang for the buck.....

     I don't agree.  In my opinion, these days, 225s are the most
     bang for the buck.  In other words, nothing has really changed.
     A push-pull pair of 3/8" flange transistors (MRF455, SD1446s,
     etc.) is the best deal.  In the early days such an amp was
     called a 75 watt amp.  That was back when CB amps were rated
     using average-reading meters.  Later they were called 150s.
     That's when the shift to peak-reading meters began.  Now they're
     called 225s.  The 225 rating is an idealized peak figure.  In
     other words, it's possible but not likely that your 225 will
     really produce 225 peak watts.

     In my opinion, 250s are not a better deal.  They are the in-
     between amps.  They are neither the best value or the best
     performers of the 2-pill amps.  If you want the best performance
     out of a 2-pill you'll get one that uses 2879s and is commonly
     called a 350.  If you want the best deal you'll get an amp that
     uses a pair of the smaller, more efficient 3/8" flange devices
     and is commonly called a 225.  The 250s are either overpriced
     225s that use 3/8" flange devices (like Messenger) or are amps
     that use lower power 1/2" flange devices like MRF454s or 2SC2290s

     and are there just to fill-in that manufacturer's line.

Dennis W. Ostrowski wrote:
>
> Bill Eitner wrote:
>
> > No. The resistive voltage drop is much less than across a fuse or a circuit breaker. That's the original reason I began suggesting this arrangement. I have several sources for large (starter solenoid-like) relays. I was concerned because I was suggesting to my customers that they should buy surplus welding cable to use as DC supply line for their amps, but there was always a significant voltage drop across the fuses and/or circuit breakers. I've seen Messenger 1200s fail because the resistance is so high across the fuses that the fuses and holders literally melt into an open. It seemed like a waste to spend money on all that heavy wire when the fuse and/or circuit breaker bottlenecks still exist.
>
> I agree.

> What we have been using here is a 100A to 200A bolt down fuse at the battery.
> They are available in gold plated fuse holders for the car stereo power buffs!
>
> I see NEGLIGABLE loss from using them.

Can you give out a source that you know of? The readers on this group are probably interested in knowing exactly where to go for fuses and holders that you know for a fact work well. I've seen alot of fancy looking, gold-plated, supposedly high-power car stereo stuff that turned out to be a disappointment when it came to real performance.

I can give a generic source for 100 to 200 amp relays that anyone can use: any automotive parts store. A starter solenoid for any old V-8 Ford will work. They are meant to bolt right to a fender well near the battery, carry 200 amps for short periods of time, and handle the vibration and heat of an engine compartment indefinitely.

> But I agree that at 150 amps or more, those AGU fuses do not do a good enough job.

No fuse arrangement that I've ever seen can handle 150 amps or more without significant voltage drop.

> If left with no other choice, I parallel a number of AGU fuseholders
> and count on their internal resistance to balance the currents between
> them.

That's one way to deal with the problem.

That's were I come in. I don't let an amp out of here unless
the customer is very clear on proper installation procedures.

I think we can both agree that if the source end is adequately
protected a load end fuse is wasteful and redundant.

> > In the other
> > amps I sell (Blue Faces) bypassing the internal fuse is a

>
> Don't thank me for fuse bypassing, because I don't think that is a good
> idea unless you know how the vehicle is wired and fused!

I'm thanking you in-part for the bias reduction mod that really
helps the Blue Face 350s and 450s. Fuse bypassing is only for
those that understand source-end positive DC line protection.
Even then load-end fuse bypassing is only offered as an option.

> For example:

>
> The system 'shares' a 4/0 wire pair between a pirate 16 pill and a 4

>
> The wiring between the modulator and the 4/0 cable starts burning next.
>
> Hopefully, the owner will notice the smoke IN THE TRUNK before his car
> is on fire!

This example is unnecessary because you misunderstood my gratification.

In any case, with the use of relays, when the driver (or control operator) is away from the vehicle there are no hot transistor collectors.

Furthermore, it's very likely that a trace or the C-E short within the 4 pill modulator will burn into an open long before there is any fire hazard seeing as how the wire is 4/0. The 4-pill may require extensive repair--but that's the chance you take when maximum performance is a goal.

> For competition use, I can condone fuse bypassing.

So can I.

> But for the average user I strongly believe that the protective fusing
> should be an integral part of every amp sold...

I don't agree. As long as the customer is made aware of the situation I think internal fusing is a counterproductive redundancy.

I need to know a particular part inside my Radio Shack HTX 100. The cap that's on the top side of the radio, down front right, with the display facing you, just to the right of the .22mf blue cap directly below IC 3 and below the resistor. Does anyone have it's value, or can tell me what's written on it? Seems there is some confusion as to which component gets removed for the mic gain mod. Symptoms are that SSB stops working, but CW output is fine.

```
 _________
[_________] <------(IC3)
       O -  <------(resistor)
         - <------ cap?????
```

     Real SWR is measured at the feedpoint and apparent SWR
     is measured at the radio end.

Greetings!

On 5 Mar 1999 15:02:06 -0600, While the Monitor displayed an idea
about "Re: What are the dB gain figures for the Wilson 1000?" from
'tnom@muck.net'. The Keyboard responded with this:

:+> >You sure about this? I'll update my notes.

:+>
:+> Yes on the 1/4 wave ground plane with 90 degree radials. This
:+> negative gain is often overlooked in some publications. In others like
:+> (TheTruth About CB Antennas, Sams Radio Handbook) It does list
:+> this negative gain figure.

Oh Geez! LOL!

My "reference" too. Amongst others. ;-)

I had the stuff in my head backwards, and is why I don't like dBi...

Considering the "flurry" of mail I got today, there will be a
Crucifixion on Easter. ;-) [SIC]

I spent most of my day, indoors, and typing my fingers off...;-)

How fitting that today, there is a "Winter Storm Warning" out for us.

Well, I think I've got the problem fixed. Hi, how are you? ;-)

Regards!
:+> Andy <+:

Greetings!

On Fri, 05 Mar 1999 17:03:18 -0600, While the Monitor displayed an idea about "Snow in Chicago" from '"Dennis W. Ostrowski" <dwostrowski@lucent.com>'. The Keyboard responded with this:

:+> I just looked out the window and we are having another blizzard here in
:+> Chicago!
:+>
:+> Phil DeCadanet's itinerary was to fly to Florida from the UK on
:+> Thursday afternoon, and then drive up to Chicago in a rental car to be
:+> at Big Blue's place tonight!
:+>
:+> Talk about a lousy welcome to Chicago!
:+>
:+> I hope he makes it here safely and that he has had some experience
:+> driving on the wrong side of the road while very tired and in a Chicago
:+> blizzard!
:+>
:+> Let's all hope he makes it safely!

I do too...

[Gosh Darn it]

And I'm snowed in out here in Michigan. Doggone it!

I'm not into pool, but I wish I was somewhere close down there to visit.

Regards!
:+> Andy <+:

All these "How much gain does XYZ mobile antenna have?" questions got me thinking........... Gain of course has nothing to do with the length of the antenna, gain is a powder that antenna makers can stuff into their coils of course. A large paint can could hold about 87dB of "gain" & make an 87dB gain dummy load that would work better than a 9 element beam. I hear Wilson is gonna "put" 3 more dB of "gain" into the Wilson 1000 next year.

I've seen these ground plain kits for mobile antennas, they have 3
radials....can someone tell me how good something like that would work?...
-Jack

>I forgot to ask you Tnom, what are the different things that odd or even
>lengths accomplish????

I don't really want to start an odd or even thread war but here is a repost of some information about the odd or even debate.

###

After much discussion on what coax length is proper to use on a mobile installation, i decided to sum up my thoughts on this subject. Before i start, i have to say that there is no such "proper" way that will suit all installations. Each method has its own advantages, and disadvantages. Each method is neither right or wrong.

These are the three methods discussed here.

1. Using the shortest length possible
2. Using an electrical half (or even) wavelength piece of coax
3. Using an electrical three quarter (or odd) length piece of coax

that is 18 feet long

Each installation of an antenna may, or may not, take advantage of all of the individual properties of these coax lengths. It is up to the operator to determine what best suits him.

....

Method ones advantages:

1. The lowest loss of all methods. *There is hardly any loss in any

method to begin with

Method one disadvantages:

1. If the shortest length falls around the nine foot area, and if this piece of coax becomes an acceptable counterpoise to the antenna, then a voltage maximum will occur at the radio. This will cause a high SWR reading at that point.

....

Method two advantages:

1. The load is mirrored at the radios end. This gives the most accurate SWR reading at the radio.

Method two disadvantages:

1. Because the load is mirrored at the radio end, a direct short or open at the antenna will result in an infinite SWR at the radio. Whereas any other length other than this length will show a less than infinite SWR.

....

Method three advantages:

1. Load variations at the radios end are spread out. This increases the SWR bandwidth at the radios end. *this does not change the actual SWR
2. This length, if it becomes an acceptable path for a counterpoise, will present a voltage minimum at the radio. This will have negligible effect on the SWR at the radio.

Method three disadvantages: none

……

It should be pointed out that the first thing you should do is resonate the antenna at the desired frequency, no matter what method you choose.

It should also be pointed out that any length of coax can be used. Its advantages are: The most convenient of them all.

……

Here is the relationship of the impedance shown at the radios end of the coax, when using a 1/4, 3/4 or 1-1/4 ect. feed line.

Zms = impedance of matching section, or coax Z
Za = antenna resistance
Zl = line impedance, or what the radio sees

$$Zms = \sqrt{Za \quad Zl}$$

Or the square root of (Za times Zl) equals Zms

So for example Za = 25 ohms, Zms = 50 ohms, then Zl= 100 ohms
or an inverted but identical match

……

I have not found a way to express the broadening of the SWR at the radio with a quarter wave transformer mathematically, but i have found the reason.

When the antennas resistance at resonance is less than the characteristic impedance of the coax, this being the normal case, and if we move off the resonant frequency we find this.

Because of the inverting action of a quarter wave matching section, the added inductive reactance at the antenna, when you go higher in frequency, is partially canceled by the added capacitive reactance, that comes from the former quarter wave section, that is now more than a quarter wave matching section.

The same inverting action takes place if you go lower in frequency. In this case the added capacitive reactance at the antenna, is partially canceled by the added inductive reactance of the now less than quarter wave matching section.

One thing should be noted. This inverting action that takes place (adding Xl with < Fr),(adding Xc with >Fr) with a quarter wave matching section inverts itself when the impedance of the antenna is greater than the characteristic impedance of the coax. In this case just the opposite action takes place. In other words.

When the impedance of the antenna is lower than 50 ohms, the inverting action works to increase the bandwidth at the radios end. When the impedance at the antenna is greater than 50 ohms, the inversion that takes place works to decrease the bandwidth at the radio. Once again, normal resonated antennas on mobiles are somewhat lower than 50 ohms.

Hmmm I have one that I bought from carl personally. We did it over the
phone and he sent it to me. That was about 2 years ago so I don't
know. Maybe the policy has changed. When I got mine I think he was the
only one selling them.

Can some one suggest to me the best ferrite mix to use for making up combinors?
I'm exsperimenting with different mixes to find the one that has most optimum
magnetic permebility and so forth. How about #43 mix is that any good?

More specifically, they have negative gain. As do any shortened quarter wave.

Put 4 watts in, get less than 4 watts out ERP.

Just got another new scope, 25MHZ. I hooked it up and dialed it in to were I see a envalope and all that but, what should I be looking for? Unless I put a constant tone like a wistle in the mike, I cant make heads or tales out of the pattern. I want to tune my box and I dont know what im looking for as far as the wave form is concerned. Do I need a signal generator or somthing?

Hello Dale or is it radiogod: You have forgotten a few things here. The bulls horns on the hood, the fox tails on the car antenna, the rifle rack in the back window, the spittin can in the back, a few empty beers cans on the dash, the "Paradise Trailer Park Parkin Permit Sticker", at least one crunched fender, but two will do, the springs coming out of the seat, the headliner hanging down, bumper to bumper rush and crunch, a few left over rusting holes from all those antennas ya tried back in the 70's, the co-pilots door held on with plumbers tape, and of course the most important thing, the multiple cracks and bullet holes in the windshield.

And probably a hole lot more friendlier than you.

Jay at jay123a@ptw.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

I am chasing some information on a Digi Scan, UFO Model made by REDCO, Reliable Electronic Design Company from the US. It is very similar to the Digi Scan DS 400 made by DIGALOG TECHNOLOGY,INC also from the US, but instead of having rocker swiitches to program it has a set of pins which you swap around. This is where I am having trouble.

Any assistance would be greatly apreciated.

Thanks in advance.

Richard.

What mod are you referring to? I have one of the old 667Vs. It gets out about 340W RMS dead key. What do the new ones do? Do they use one 2290 and 4 2879s?

Thanks,

 Did you try it using the same coax and radio for input? maybe the radio he is
using or the input match is different.. Or his grounding system is inadequate.
You have the volts, so It is either coax match or drive amount or match.

>Good friend of mine has an amplifier that is doing let's say 500 watts at 18
>volts. Problem is when he puts this amplifier in other people's mobiles we

Iam interested in the emeror TS-5010.
1- new in the box..
2- has it ben open up..
```

3- or peak out
4- power mic with it.
5-or stock mic with CHs switch on it.
6- CHs done--feq-(26.515--30.9)
7-is audio cut out.

thanks Jim

I have a Para Dynamics PDC357 counter, and it gets really hot, just being on. I had it apart to have a look, and there is a transistor that is using the bottom cover as a heat-sink, but should it be getting really hot, just sitting idle?

One other question. I have seen newer PDC357's advertised as having a HOLD button. Mine does not have this option, though it has a solder pad on the board labeled "HOLD" with nothing connected to it. If anybody knows what type of setup there is with the switch and the spot on the board, please let me know. Is it a on/off switch, or a momentary push button, etc, as well as where the power (or ground) comes from, that hooks to the switch and then to the HOLD pad, please let me know!

One other thing...The specs that came with it are a crock of shit! I tried to do a radio tune up, and couldn't finnish it because it wouldn't pick up the frequency! It says it has an input sensitivity of 20mVp-p, and I was trying to measure a test point that had 55mVp-p!

Anybod know where I can get a REAL 7-digit frequency counter that itsn't going to drain my bank acount? Or should I write the company and complain about there bull-shit specs?

The PRO-50 covers 30-54, 137-174, and 380-512 MHz. The only way you're
going to get frequencies outside those ranges, basically, is by
getting another scanner that includes the ranges you want.

As for a list of frequencies...mine wouldn't do you much good unless
you're in western NY.

Good Luck...

I just drove out of Chicago last night , it was fun in the snow , stayed in Schuamburg for 2 weeks on training at Canon USA . I love those Portillo's hot dogsand UNO's Pizza , also was impressed by G.A.T. guns , I had a long time friend that lives in Barrington Hills show me around town , Great place to go to or even move to .

sounds like good advice. How about recommending a good model # and make
for us beginners looking to buy one. Thanks

Rick

As far as a radio is concerned the apparent SWR is very real
at the radios end, and the real SWR is of a lesser concern.

March 4, 1999   filename: nss0304.txt

Merle Parton,

In case you don't know the latest developments at NSS, let me update you.

NSS was decommissioned in early 1996. The sole remaining facility employee is John Schorpp, the antenna man.

The towers and transmitter building are scheduled to be demolished by September 1999. There has been an appropriation of $4.2 million to demolish the site and convert it to a wildlife preserve.

There is a group of people, including John Schorpp, and now me, who learned of this development only this past weekend, that want to stop the demolition and convert the site to a museum of VLF radio technology.

As a member of the Antique Wireless Association, I wrote a letter to its president last night, citing the few facts I know, and asking what it might be able to do to aid this venture to convert to a museum. The AWA operates a large communications museum in Bloomfield, NY, just south of Rochester NY. It has ties with the Smithsonian Institution.

There is a public hearing in Annapolis March 8, 1999. The time is 6:00 p.m. of the Lowe Office Building. That's all the address I have. I have handwritten directions to it that John Schorpp handed out at a hamfest we attended this past weekend.

John Schorpp has asked me to ask you to consider putting a notice of this meeting on the NSS Web page. I know this is short notice, and there isn't even a complete address, but let me give you my name and phone number: Pete Sypher, 301-601-2711. I'm going to the meeting. I'm going to spend time and effort for this cause of converting the site to a museum, even though the chances of this being realized are slim, in my estimation.

73, let me know what you think about all this.

Pete Sypher

     No?  Well, I've got  5/8 wave 2-meter and a 5/8 wave 440 antenna each
mounted on my car and I'm sure that they exhibit substantial gain over a 1/4
wave antenna.

Ok i have been doing some checking here ..
goldenrod
gain 4.75db
frq range 26.2-29.5mhz
12kw max power
4 foot 3 in height
11 oz weight.

super penatrator
frq rang 25-30mhz
3.5kw max power
longer than golden
heavier
```

built with stainless steel stronger than aricraft aluminum. I have never owned a golderod (nicename) Ihave had a SP bic-11 for years. I would like to try one. I dont know what the db gain of the SP is I know its 5/8 wave. The problem I have with the 45 is the aluminum construction. Stainless steel will last a lot longer in harsh conditions and it seems that the bandwidth is better on the penatrator across the board. Now as far as max power in well how many of us run 12KW? Or how many run 3.5KW either. Thats a lot of mods you have to do to your vech. And a lot of cash. I am not ripping on people with the 45 at all. I would like to try one and compare. I looked at both manufx sites and they leave out a lot of info on the antennas that would be nice to know. Like the db gain on the SP or the the radiation patterns would be nice too. Well thats my 2 cents worth.

> looking for all-around performance."
> I stand by my writing.

>

The duel antennas will work better that a single antenna, but only by a small amount. If you look at the ARRL Antenna Book, 18th edition and look at page 8-6 you will see that at the two top left hand antenna patterns. These are for two antennas feed in phase spaced at 1/8 and 1/4 wavelengths, and they show a slight amount of gain at the sides, and a slight loss of energy to the front and back. Oh yeah installed antennas will show a difference in gain and energy patterns. How many duel antenna systems are in use today, and they work pretty well. They work good enough to not really tell the difference between a duel and a single antenna, being only a few dB difference.

> > and so does a center mounted single antenna.

>Frank

I have used a cobra hh35wx. the things i didnt like were: rubber duck antenna fine for very local work, but obviously better range will be had with a loaded telescopic accesory antenna; and, the aa nicads i used from rat shack werent always reliable. one out of the bunch would go bad and spoil the performance of the ht. also, at times, the cells would not make good contact to the radio and i would have to "slap it around a bit" to get it to work.

thus: get an ht with a slide on slide off battery pack for good power reliability; and carry a performance antenna with you when you need the extra few miles. cherokee has one of these antennas, but expensive. rs has a special order one, i think, but probably will break easier(telescopic). less expensive though.

good luck!

Now there is a beam that  ihaven't heard mentioned in years.
```

A very nice beam. I still have a a five element version that I maight one day
put back up inthe air.

Greetings!

On 06 Mar 1999 05:11:37 GMT, While the Monitor displayed an idea about "Re: coax length" from 'icecoldnyc@aol.comIceCold (ICECOLDNYC)'. The Keyboard responded with this:

:+> Hey Toll,
:+> For those that aren't sure.....
:+> What is the difference between REAL SWR and APPARENT SWR??????
:+>
:+>
:+> ICE, ICE & MORE ICE.... ICECOLD Big Apple Trees Just Got Down!!!!!!!!

In short...

Real SWR, is what the SWR is, that the system sees.

> SYSTEM - means the radio, coax and antenna as a whole. The SWR exists from the antenna standpoint, working with the tuning of itself, to the radios own output.

Apparent SWR, is the point of insertion of the SWR meter into the system, the meters own observation of the SWR at that point in the coaxial line. This can vary. Due to constructive and destructive standing waves that occur along the coaxial line.

> Apparent SWR can be thought of as the SWR that exists anywhere along the length of the coax. This may be different from the antennas own SWR it presents to the rest of the system.
>
> To determine Apparent from True SWR, you'll need to use random lengths of coax for the patch cord of the SWR meter. The change of the coaxial length in the overall system, would change the Apparent SWR, while the True SWR will not change.
>
> The apparent SWR will be closer to the True SWR measured at the feedpoint of the antenna. The antennas own SWR should be used to determine if you have Apparent SWR readings at any given point along the coaxial line you check with a SWR meter.

This is the best way I can put it. It all depends of the point of view used for the SWR meters location on the coaxial line. At the antenna, the SWR may be one reading, while at any given point along the coax, you may see a different SWR reading. The coax is placing itself as part of the radiating portion of the system, instead of being a conductor to transfer energy from and to, the radio and antenna.

There is also another event of Apparent versus True, that's dealing with the change of impedance that occurs between amplifier stages that can cause the overall input and output impedances of the stages' connection to previous, and subequent stages.

Apparent, is like a point of view of an event.

True, is based upon factual, or physical evidence of an event.

Research needs to be done to determine if you are viewing Apparent or True SWR. So, the SWR really should be checked in at least, two points, or at the antenna, and a random length along the line. The differences, if any, give you the SWR at that point, and if it has changed from the antennas own SWR, you are then into a problem with Radiating coax, and the system suffers in performance due to it.

Hope this helps...

Regards!

Greetings!

On Fri, 5 Mar 1999 22:22:27 -0500, While the Monitor displayed an idea
about "Midland 77-115" from '"Christan" <nospamcombsad@erols.com>'.
The Keyboard responded with this:

:+> Does anyone know if the Midland 77-115 cb radio has a noise blanker built
:+> into it, I know it has an ANL switch on it but I have seen adds on the
:+> Internet that says it has both a ANL and noise blanker.
:+>   combsad@erols.com

None that I know of.

Was working it over on Friday. It only has ANL, but I found that it
also has some very supceptible ears for bleedover.

I found some stuff that you can use to help increase the modulation.
You might have to cannibalize other parts from another radio though.

But, I have yet to find the NB, which I don't think it has. You would
have to upgrade the board in it to do so.

It's missing the stages it would need for NB to work. The board
doesn't have the spaces in which you could "add" in components to
accomplish that.

Greetings!

On Fri, 19 Feb 1999 09:35:13 -0500, While the Monitor displayed an
idea about "Max performance" from 'CB Guy <solawear@earthlink.net>'.
The Keyboard responded with this:

:+> I have recently bought a Cobra LTD 25 Classic WX radio and want to know
:+> the best way to get the maximum performance out of it. It will be
:+> installed to a 96 F-150 and have 2 Firestik Antennas. I would like to
:+> mount the antennas to the sides of my bedliner if that is where I can
:+> get the best perfomance. Or maybe how I can get the best perfomance
:+> where they will be. Any and all help is appreciated.
:+>
:+> Thank you,
:+> handle name:
:+> SuperMan

Well, welcome aboard!

Let's see, you want to use 2 antennas? And you have a pickup truck.

Well, If you want to use the bed, co-phasing can work well. The only problem I see is with the height of the bed, to the front cab. It might cause a problem or two. Height is very important when trying to be heard, versus buried in the mud.

Co-phasing, requires a harness, and your understanding that the antennas will have a directional pickup pattern.

If you can live with that, then the following should help you.

If you haven't already, plase visit the Firestik Antenna Company Web site at http://www.firestik.com and follow along...

You'll need a phasing harness, that uses RG-59, or 72-75 ohm impedance coax for the phasing to work and tune well.

Mount the antennas close to the mid-length section of the truck if you want good coverage both front and rear. Closer to the front or back, and you get very directional with main reception being the longest section of the metal panels the truck has, for ground plane effects that will occur and the antennas will work the metal of the truck better in those directions.

Once the antennas have been located, mounted and you're ready to put the coax together to connect them, I hope that you've visited the Firestik site by then. They have the tips you'll need to tune them.

The only thing more I can suggest; If you're using the bed to hold these antennas, get the longest antennas you can accept to use on your vehicle, for height of the cab, and the overall height that the antennas can use for both tuning, and radiation pattern these will develop, higher [or longer length] is better.

If you have problems with noise, you can check out http://www.iserv.net/~codyspc/engine1.htm - and take the test. Then follow the links to areas that you need to look into to help reduce noises present in your vehicle.

Aside from that, the antennas directionality is produced by the interference pattern thats generated by the antennas as they work with and against each other. The lobe patterns are stronger towards the constructive waves that are enhanced by the two fields the antennas generate [perpendicular to the location of the two antennas along the horizontal axis drawn as a connecting line between the two], with the destructive interference from the co-phased signals that, being out of phase, will lessen, or weaken the signal pattern arriving or being sent out, from the paralleled regions.

For phasing, you can use slightly different lengths of coax which will change the pattern these two antennas will generate.

The best method is to use the harnesses that are supplied. These will provide the proper impedance, and the correct phase, the antennas will need to work properly.

Hope this helps.

Miles asked:
>When did 11-meter capable HF gear become illegal?
```

K5PF:
11-Meter capable HF gear is not illegal. However, it must carry a type-acceptance sticker. You may be referring to the famous Amplifier Law.

In 1978, the Federal Communications Commission banned the manufacture and marketing of any external radio-frequency power amplifier or amplifier kit that is capable of operation on any frequency below 144 MHz unless the FCC has issued a grant of type acceptance for that model amplifier.

Q. Is it illegal to use amplifiers on 10 meters?
A. No. Amateurs may use such amplifiers. While the rules make it difficult to BUY a new amplifier capable of operation on 10 meters, the FCC allows amateurs to MODIFY an amplifier to restore or include 10-meter capability. An amateur may modify no more than one unit of the same model amplifier in any year without a grant of type acceptance.

Amateurs may build amps, convert equipment from any other radio service for this use, or buy used amplifiers. Nonhams are specifically prohibited from building or modifying amplifiers capable of operation below 144 MHz without FCC type acceptance.

Q. Can a dealer modify amps if they are sold only to licensed amateurs.
A. No.

Q. What type of amplifiers may a dealer sell?
A. All external amplifiers capable of operation below 144 MHz must be type accepted by the FCC in order to be marketed. A waiver was issued to amplifiers manufactured prior to April 28, 1978.

Q. What does Type Acceptance mean?
A. Type acceptance is an equipment authorization granted by the FCC. It is based on equipment data submitted by the manufacturer and is used to ensure that the equipment will be used in the proper manner of the service for which it has been accepted.

Q. Why was the 10-Meter amplifier ban imposed?
A. The FCC said this action had been taken to specifically address the "illegal use on frequencies in and around the Citizen's Band Radio Service."

While I respect the length of time you have been licensed, I disagree. "Ticket" is the slang term for "license" and is used in the amateur hobby as well as professional circles.

If keeping the "ham vs. CB" threads going gives you guys some kind of fulfillment, please continue. However, you need to step back and take an unbaised look at how far this thing has been stretched. Arguing over who does or does not use certain words usually is a sign that a thread has outlived its usefulness.

It has been suggested that reading a thread beyond the seventh message is a waste of time. By then, the original topic has been exhausted and it has been reduced to slurs, name-calling, and inaccurate information.

Agreed. I recently recalled something which I read early in my venture into Newsgroups. Reading beyond the seventh message in a thread is useless. By then, the original topic has been covered and the thread moves into name calling and slurs. Very little useful information remains.

I call it the "Rule of Seven", or NG-7 for short. Hope others will join you in not oiling the squeeky wheel, Dave!

:>speeding driver. I have yet to hear of a person being killed or mamed by
:>"Skip"
:
:No, I'm referring to the act of speeding which you raised as a
:comparison to illegal CB radio operation. If you don't think they
:compare because one has the potential of killing and the other
:doesn't, then you shouldn't have made the comparison.
:
:However, if you are going to make the comparison, it is worth noting
:that when you speed (perhaps to keep up with existing traffic) you are
:aware of the effect of your actions. You know you're not weaving into
:oncoming traffic and running other legally operating drivers off the
:road. Similarly, if you did run someone off the road, you would no
:doubt care.

Using an amplifier is like keeping up with traffic. And I am aware of my
actions if I am in my car or on the mic. I also know the latter does not
pose a danger.
:
:When you run illegal power you don't know that you're denying service
:to legal operators. Worse, you don't care. IBers make CB "Radio
:Tiajuana".
:
:>:To me the analogy of illegal CB practices is similar to your tossing
:>:your trash out the car window (thereby impacting others who have to
:>:look at your unsightly mess), or shooting firearms randomly into the
:>:air with little regard to what damage they may cause as they fall.
:>
:>Kids running and sreaming uncontrollably in public areas, lawyers working
:>overtime to redistribute the wealth. Hey! sometimes lifes a bitch grin
and
:>bear it.
:
:However, the analogy of illegal CB practices remains. It is similar
:to tossing your trash out the car window (thereby impacting others who
:have to look at your unsightly mess), or shooting firearms randomly
:into the air with little regard to what damage they may cause as they
:fall.
:

:>:What you obscure by your driving example is the victims which are
:>:created by illegal radio practices; the denial of service you cause
:>:legal users. To equate this to driving practices: if you exceeded the
:>:speed limit (by 25-30 mph, per your example) and caused an accident
:>:you would be held at fault and perhaps receive additional charges such
:>:as reckless driving (at those speeds).
:>
:>What about the death, injury and damage to the other persons property?
:>Illegal CB use poses none of those.
:
:You're the one who made the comparison. What about it?

Like I said before there are more serious problems in this country that need
enforcement and CB radio just doesn't or shouldn't rank high on the list.

Sometimes more sensitive but never ever more selective. Go check the specs and/or use a antenna switch to compare selectivity.

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 20554

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's rules regarding equipment that is intended to operate in various radio services in the high frequency radio spectrum, including "10 meter" Amateur Radio Service (ARS) equipment

The Commission has noted that a number of transceivers imported as ARS equipment are also capable of transmitting and are being operated in nearby frequency bands allocated to other radio services such as the Private Land Mobile Radio Services,Maritime Services, Auxiliary Broadcast Services, International Broadcasting Services, the Citizens Band Radio Service, and the U.S. Government. Operation of this equipment causes interference to the authorized users of these frequencies. Some of these transceivers are capable of using output powers or emission types which are not permitted for the radio services listed above and some are capable of transmitting in the radio astronomy band where no two-way radiocommunication is permitted. Some manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export' radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio servce(s) in which the transmitter is capable of operating; (2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued: or, (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission issued station license. Violation of the Commission's regulations will subject manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment In addition, the equipment described above can be seized by, and forfeited to, the government

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road. Columbia. Md. 21046, (301) 725-1585, extension 223, or E-maiI: ghendric@fcc.gov.

****

In other words owning an amateur radio is legal without a license.
Modifying your own radio for 11 meters is legal (this assumes that
the mod was done for receiving purposes). Transmitting is illegal.

It only requires a "type acceptance" sticker if the radio is to be
used for transmitting purposes on 11 meters.

Four times I have called Copper Electronics. All four times the operator is always rude, and it always seems like they are trying their best to get me off the phone as quick as they can. Every question I asked, the operator just let out a sigh. I was ready to order $400 worth of merchandise, but after the

operator's attitude, I changed my mind. I told her that when she thought she could answer a couple of simple questions and give good customer service without letting out loud sighs, call me back. No one called me back. I guess that is their loss. But I would not recommend anyone to buy from Copper just for that reason. Good Customer Service is a must!
If you want great service with great prices, call Coaxkid at Left Coast Radio.

>
> But do we encourage it?

I don't.

But I do understand why people do it.

And I encourage good engineering practices.

I'm also one of those folks who advocate giving addicts clean needles
and enough drugs to stupify them till they die; because I see it as a
cheaper alternative to the war on drugs and a good way to lower the
crime rate.

> and when does denying someone access to public
> property constitute a "minor infraction"?

When you agree to accept that interferrence from other stations as a condition of using the band as described in part 95.

> When was a possible $10,000
> fine a "minor infraction"?

When the lawyers get involved.

Kinda like 20 million for 'a dumped cup of coffee'; or 3 million for' tripped on your doorstep'; or 1 million because 'I was a passenger in a car you bumped into and am complaining about whiplash'!

I am not a proponent of any of those things, but I can understand why
people do them.

I try to talk folks out of illegal mods, noise toys, roger beeps,
echoes, dirty linears, and especially out of band operation, because of
the extra problems they bring with them.

- >I am not a proponent of illegal operation, but I can understand why

Stating an opinion does not make me a proponent.

There are supreme court justices who frequently state their opinions on
legal issues; that does not make them proponents of those things they
stated their opinions on.

> Yes, I think it's great that you try and discourage the use of noise toys and
> dirty amplifiers. But you could be doing more.

I am already doing more than you are!

> If you honestly don't condone
> illegal practices (i.e. illegal mods, frequencies, and amplifiers) you could
> stop dispensing advice about how to install, troubleshoot, and perfect these
> illegal devices.

Why?

They will only get that advice somewhere else if not from me, and it might make their stuff even dirtier!

> I notice a lot of the tech questions in this newsgroup
> solicit opinions on "What's the best [illegal] amplifier to buy?"

And I suggest the one that operates with the least harmonic distortion and least likely to overload.

The man is obviously looking to but an amplifier, and probably will do so.

Bt providing direction to a clean running one I have possibly kept one more dirty running one off the air.

>, or "How do I
> mod my radio to operate on [illegal] frequencies?".

I don't have anything to do with any radio mod questions, so why does everyone keep saying that I do?

> The "it's for information
> purposes only" excuse doesn't cut it.
> Neither does the "they already own these
> amps" excuse.

I disagree.

> The results of your "advice" have a pretty high probability of
> showing up on the air -- in the form of an export radio transmitting out of
> band, or running illegal wattage.

Now you are really beginning to pxxx me off!

I don't have anything at all to do with radios of any kind and yet you say I have something to do with export radios transmitting out of band or running illegal wattage because of what I have posted to this newsgroup.

You couldn't be any more wrong!

You had better pull up all my posts for the last year and read them again because Im have NEVER, EVER posted anything like that on this newsgroup!!!

What gives you the right to make such an accusation without even doing the research to make sure you have your facts straight!

> I'll grant you this: you are absolutely correct in saying that you are
> perfectly legal. It's true. You don't sell amplifiers. And it's not illegal to

> tell other people how to fix them.

I don't tell them how to fix them!

Find ONE example of where I did......

I answer specific questions from people that are in them fixing them already.

I make recommendations to make amplifiers run cleaner instead of dirtier.

I try to educate them as to why they shouldn't overdrive them or run them without bias.

By doing that I truly believe I am making things better.

> It's not illegal to tell people how to
> modify CB radios to transmit out of band.

I have never, ever, done that.

Don't even suggest I did unless you can quote some old post as proof!

> It's not even illegal to get on a
> public forum and say "the average 11 meter operator needs to break the rules (
> (i.e. illegal mods, frequencies, and amplifiers) in order to communicate with
> each other".

That's true, but even then you are quoting out of contact and not quoting the whole statement where I said that" I CAN UNDERSTAND WHY the average 11 meter operator needs to break the rules.......etc.,etc.,....

> But by doing all that, you are contributing indirectly to making on-air
> conditions worse for everybody.

But I am NOT doing all that!

Once again you better do your homework before you start making statements like that!

> - Your advice results in someone buying an illegal amplifier.

Not true.

My advice may result in them buying a different amplifier; one that runs cleaner than one of the others they would have purchased without my advice...

> That's one more
> amplifier getting put on the air,

That amplifier would have been there anyway.

Since I don't sell amplifiers., I cannot stop selling them.

Someone else (usually a HAM operator) is selling those amplifiers, and the bulk of them are extremely 'dirty' in operation.

I try to direct them to a cleaner running one.

> creating the need for other users to buy
> amplifiers to overcome the interference caused by the first one.

I am not creating the need because I am not selling the amplifiers, and I am not effecting the quantities of amplifiers sold, I am just trying to convince those who are going to buy one, to buy a cleaner running one so there will be less interference overall!

Why is that concept so hard for you to grasp?

> - Manufacturers and distributors of amps specifically designed for [illegal] 11
> meter use are encouraged to come out in the open and begin openly soliciting
> business, creating more amplifiers going on the air and more interference.

Not by me!

Show me a single post where I encouraged any amplifier sales by any dealer on this newsgroup!

You won't find any!

> - A newbie reads advice given in this newsgroup and comes under the mpression
> that it's OK to use illegal frequencies and illegal power. More amps get put on
> the air, and more interference results.

I can agree with that.

This newsgroup was like that before I got on it and it will be like that after I am gone.

My presence here has not had any effect on that, pro or con....

What my presence here might have had an effect on is that the newbe may buy a cleaner running amp if he was going to buy one anyway, and I might also have some influence in keeping him ON BAND and off the illegal frequencies.

> << * Is "everyone else is doing it, so I can too" a justifiable argument to
> break
> the law and encourage others (by example) to do so?>>

No.

> In my opinion, the issues we've been discussing (in the context of the
> federally-regulated radio spectrum) are not a minor infraction.

In my opinion you are discussing the issues in the wrong context then.

If the HF part of the radio spectrum (and I mean ALL the HAM frequencies as well as the CB frequencies) would have been effectively Federally Regulated all along, we wouldn't have the problems we are discussing right now.

> They can (when
> enforced) carry heavy fines and penalties.

I think the heavy fines are part of the problem.

There is too much inventive to 'take it to court' and get the fine dropped or greatly reduced.

I see the problem as being that the 'good' radio operators have are not empowered to keep the 'bad' radio operators in check.

When they take it upon themselves to try to make things better, they are ignored by the government agency responsible for helping them achieve that goal.

They get frustrated and see that the violator seems to have nothing to fear even when the locals turn him in, so they figure it must be ok to be a violator....

And being a violator is much more fun!

We are battling human nature here gentlemen!

Add to that the money to be made selling those illegal mods and devices and you have a serious problem!

If you are picking on me because you believe I am a 'figurehead' representing the problem, you are aiming in the wrong direction!

Have a good weekend!

Dennis

You are very close.

Remove this text from your last sentence: 'the prevalent illegal
behaviors on CB, and'

And you have it right.

Depends on the condition...

If everything is in excellent condition, and hasn't been 'modified', I might do it for $300. Check out the 2000 very carefully - there's some real 'dogs' (read "butchered" / "junk") out there...

Good luck,

John

Exactly. If HF 11meter gear was illegal, there would be nothing to use on CB.

I have just bought it today it looked pretty good i bought all the stuff for
it so i could use as a base unit i bought a 3amp dc power supply and a smart
cb base antenna i am not getting hardly any range at all i can hardly pick
up anything i got a hand held its a 40 channel Eurosonic and it wouldnt
even get down the road with me speaking to it is it my cb or antenna i live
in the UK if there is anyone with this cb could they please email me and
tell me what kinda a range they get and if they get far what antenna do they
use i fell pretty pissed of paying �100 for the cb
�30 for power suppy i�10 for coaxil cable and �20 for the antenna what is
wrong here.
I am new to CB's as you can see please reply thought
sletchet@dircon.co.uk
Thanx in advance

Yeah, But when you get your receipt, it says, "ALL SALES ARE FINAL" Why? Because Tony knows if he get's the radio back, He can't sent it back. Why? Because it's a refurbished radio and those have NO WARRANTY!

Yeah? Well explain why you sold a radio to a very good friend of mine and the channel selector locked on Channel 19 and YOU REFUSED to take the radio back? Explain that one!

I am trying to say that the HAM operators are a MAJOR part of the problem!

I'm saying that if they are not directly transmitting on the 11 meter band, they are somehow involved behind the scenes with the illegal sales of linear amplifiers, or the modification of export and HAM radios for use on 11 meters.....

Follow the money trail and I'll bet you find a HAM operator!

I never brought any of this up until those holier-than-thou HAM operators started blasting all those ILLEGAL operators on the CB band and insisting that they (the HAMS) were part of the solution and not part of the problem!

>
> Dennis:

There's more than one way that a HAM can be a nuisance on the CB frequency.

There is the direct nuisance, and the indirect nuisance...

> Consider this though: hams, by virtue of the fact that thier
> identities and locations are a matter of federal record are a bit easier to
> "bust".

Only if you assume that they will IDENTIFY their stations while being a nuisance...

NOT LIKELY!

> It's much harder to "bust" an unlicensed operator and takes a lot more
> federal resources to do so -- for example,

I disagree.

> the problem operator you said that
> you tried unsuccessfully to bring to justice. Was he a ham?

Someone told me that he is, or was, but I have no proof of that.

I do know he has ham gear, arrl license manuals, etc... on the premise.

Dennis

<<<I don't have anything at all to do with radios of any kind and yet you say I have something to do with export radios transmitting out of band or running illegal wattage because of what I have posted to this newsgroup.

You couldn't be any more wrong!

You had better pull up all my posts for the last year and read them again because Im have NEVER, EVER posted anything like that on this newsgroup!!!

What gives you the right to make such an accusation without even doing the research to make sure you have your facts straight!>>>

Thanks for giving me permission to pull up your posts for the past year. I would not have done so unless you suggested it. I only looked as far as the past month or so.

Most of your posts deal with RF. My assumption that you have given advice on how to mod radios to get extra channels was wrong. For that, I apologize.

I see by your posts that you specialize in RF amplifiers.

I'm reading one right now where you advise a fellow looking to build a 1000W illegal 11 meter mobile transmitter to opt for a 600W illegal transmitter instead. In it, you specifically recommend that he drive the illegal amp with an illegally modified ham transceiver.

It's pretty embarrassing. I won't post it here unless you demand I do.

Dennis. If you have his full name it is easy to cross search the online FCC database. If you have his name you can find out if he's licensed and what his call letters are in a second. Go to:

http://www.tarc.org/hamradio/callook.htm

Or post or email his name to me, and I can do it for you.

I'm offended by your attempt to remame the Citizen's Band by referring
to it as the Illegal Band!

That is the type of attitude that really puts me, and most CBer's, into
the 'defensive' mode!

And that is not at all conducive to solving the problem...

> - It is not legal to sell a radio that has 11 meter transmit capability.
>
> Really? All this time I thought all the CB retailers selling "export"

> Obviously Left Coast is full of baloney about xmitting on CB with a
> non-type accepted radio.

Where does he say TRANSMIT?

I believe it specifically states MAY NOT TRANSMIT!

I would have thought someone like you would be capable of reading a
little more thoroughly and accurately!

> But are you telling me it's illegal to sell
> these things?

As long as they can't transmit they are probably legal.

And a HAM operator could legally purchase one and use it on 10 meter
band for both transmit and receive.

But neither the HAM nor the CB operator could legally transmit on the
11 meter band with one because they are not type accepted for that use!

> and to own them?

Anyone can own a receiver...

It's the transmitter part that gets illegal.

> Do you have a cite for this?

Part 97.

> I'm glad we agree. I'm not pro-ham and not anti-CB.

That's not the way you have been coming across on this newsgroup.

> I'm not a ham
> (although I feel I have no choice but to look at becoming one) and I
> am a CB operator.

I hope you get your HAM license soon; you will fit right in...

> I don't care who's showing disrespect to my radio
> service,

YOUR RADIO SERVICE?

I suppose it was YOUR CHANNEL too!

It's no more your radio service that it is the person's whom you say was guilty of disrespecting you.

> except that those who know better (hams) should receive 10x
> the penalty.

I agree their penalty should be much greater for ANY RULE INFRACTION.

Why don't we make it a minimum of 10 years in jail without parole!

That's how ridiculous this whole penalty process seems to me!

> This isn't a partisan issue with me. (I can't say I've
> seen any of the ham CB users portray it as such either.)

Whatever you say.......

> As you know, I'm increasingly finding it difficult to consider these
> guys as good guys.

They are good guys in that they don't come on to the CB newsgroup 'flaming' all CB'rs!

> At a minimum I would expect them, deriving their
> livelihood from these <cough> questional practices, to lead the effort
> in redefining CBRS into a more modern and practical service (something

Don't hold your breath!

> You may
> not agree with me, but hopefully you'll understand why I feel these
> guys are profiting by making my radio service less useable and less
> respectable.

I'm not blind.

I can see what is going on.

I see a lot more and further than you do or you wouldn't be critiquing me so frequently, you would be directing your efforts elsewhere!

I'll say it one more time:

FOLLOW THE MONEY!

It ain't coming to me!

Dennis

Hi,

I have a Cherokee CBS 1000 CB base station for sale, it covers
25.165Mhz/29.655Mhz. Large Tx and SWR/Modulation meters. Tx and Rx married
Tweaked and Peaked.. 12 watts AM and 20 watts SSB. Scan feature. AM/SSB.
Real clean, only 2 months old, must sell. Asking $225.00 + shipping.

You, I, anyone, can own one if the transmit is disabled.

A HAM can own one that can transmit on 10 meters, but it should not be sold with the 11 meter transmit enabled.

If the HAM, the CBer, or anyone else transmits on 11 meters with that non-type accepted radio it would be an illegal act.

If the HAM modifies that radio to enable it to transmit on 11 meters he would have no reason for doing so unless it was for the sole purpose of committing an illegal act.

Is this clear enough?

Dennis

> fashion.

Not always true.

The things I post are not to the detriment of ANY users.

> You may retort, "skip and Latin American stations deny
> communications"

They don't deny communications, but they make it next to impossible to do it legally.

> but further violating the rules and regs only makes it

> that much worse for those who don't violate the rules.

That is probably true, but in some cases it's not.

A good scenario would be those CBers who like to run power and talk out of band.

The fact that they left the normal band made it better for the legal users remaining there.

> Instead of
> contending with skip and an overpowered station broadcasting espanol,
> now I have to deal with a five miles ahead of me pushing 100 watts or
> splattering due to a mod performed by most techs I've seen (i.e.,
> incompetent).

The problem is more from the splattering radio than the power.

Radios splatter, linears don't...

If he had a clean radio and amp, you could go up or down one channel and probably not be bothered at all unless you were only a block or two from him, and if he was that close and was ignoring you; you could simply plug his ears with your legal radio until he acknowledged your existance. If he still did not acknowledge you and you were that close, then you had a serious radio or antenna system problem and shouldn't be griping about non-acknowledgement!

> > Nor does it indicate that I am a catalyst for such events.
>

> event, but everyone would know that you endorse making life worse for
> everyone else who uses the park. It merely reflects on you in my
> opinion.

Then you better tell all those writers of the murder mysteries that they are contributing to murder, because they explain how someone might commit a murder and not get caught.

Murder is much more serious.

When you can get them to stop writing those books, then I will listen to you a little more seriously!

If I wrote a book about 101 different ways to let a dog crap in the park without getting caught, it would not be illegal, nor would I ever be taken to task for writing it.

There may be people who don't even own a dog who would buy such a book because they would be interested in learning what techniques I would have used to not get caught. They could be interested in the book and yet not have any intention of getting a dog and taking it to crap in your park!

> Finally, another example of your difficult-to-decipher logic which I
> don't believe helps us arrive at mutual understanding but instead
> keeps the issues cloudy. Your hypothetical instances of protected
> speech all seemed to be speech involving consensual partners. For
> instance you said "having sex with Pamela Anderson" and "overthrowing
> the government with promises of [trinkets to the people]".

That's correct.

> You didn't
> say raping Anderson;

No I didn't.

> and you implied you would be voted into office
> via the trinkets to the people.

No I didn't.

> You then assert that none of this
> implies you plan to "attack Anderson" or "overthrow the government."

That is correct!

> This is the kind of non-sequitur which keeps the debate going.

Quit making statements I need to address, and the thread will end.

> The
> free speech on this newsgroup involving illegal radio operations
> *does* impact legal users.

Not true.

> It takes away their ability to use a
> public resource which they, as legal users, are the *only* users
> entitled to such resource.

I don't believe that anything I have ever posted on this newsgroup has ever had anything but a positive effect on the conditions for legal users.

> As I said, a better example would be your
> encouraging people to drive down the wrong side of the road, or dump
> their trash in public places.

I disagree.

> Such speech may still be protected, but
> at least we know the kind of social order you promote.

 You don't have a clue Mark!

Dennis

I agree with your position. However, leading addicts or illegal CBers to less harmful practices does not dispense with their responsibility when they (in their drugged or over-powered and out-of-band stupor) violate the rights of others. Nuisance, loittering, public intoxication, and other such unpleasantries remain crimes which the non-addicts and legal CBers will complain about -- and rightfully so.

>> and when does denying someone access to public
>> property constitute a "minor infraction"?
>
> When you agree to accept that interferrence from other stations as a
>condition of using the band as described in part 95.

Could you quote the relevant section from part 95 which says legal CB operators agree to accept interference from non-type accepted radios, or illegal linears? That is what is a crime, and it is what seems fairly serious in potential penalty. Just because CB operators accept interference from legal operators does not sweepingly justify or make minor the illegal acts of IBers (Illegal CBers).

In article <3704FA61.3654D3CF@lucent.com>
"Dennis W. Ostrowski" <dwostrowski@lucent.com> writes:

> I try to talk folks out of illegal mods, noise toys, roger beeps,

I noticed you said illegal "dirty linears." Do you try to talk folks out of illegal "clean linears"?

In article <3704FB7C.D8124378@lucent.com>
"Dennis W. Ostrowski" <dwostrowski@lucent.com> writes:

>
> You are very close. Remove this text from your last sentence:
>
>   'the prevalent illegal behaviors on CB, and'
>
> And you have it right.

What is it about that clause that you take exception to? Is it that you don't believe illegal behaviors are prevalent on CBRS?

In my area the illegal behaviors are prevalent. I believe those operating illegally are a minority compared to those possessing CB radios. But those operating illegally are operating far more often than everyone else. It is in fact rare to hear someone say they have a type accepted radio and/or not running a "footwarmer".

Or is it that you don't feel crime among the underclass, and illicit drug use, "describe the prevalent illegal behaviors on CB"? The more I think about it, the more I feel it describes illegal CB activities adequately. The criminal and drug user/pusher always have some excuse about why they do what they do. Their mother spanked them too hard in public; they didn't have the "opportunity" others had, etc. Illegal CBers seem to employ similar rationalizations for their practices. IBers (Illegal CBers) can't live with the capabilities of the band, and they demand the "opportunity" that users of other bands have. This injustice of inopportunity becomes the overriding factor in their breaking the law.

Like other criminals, IBers can't work to make changes to the system, or live with the reality of the system. Immediate gratification is required and they will have it even if it is at someone else's expense. At bottom, however, there is always soeone else to blame it on.

I'm a CB'er and it is my concern when IB'ers (Illegal Band) try to downplay their illegal activities. A possible $10,000 fine and federal jail time doesn't sound like "speeding" or "jaywalking" to me.

>:No, I'm referring to the act of speeding which you raised as a

>
>Using an amplifier is like keeping up with traffic.

It is? I've never seen someone step on the gas pedel and run someone off the road twenty miles away. :) However, I have seen endemic speeding and illegal amplifier use result in one-size-fits all laws which penalize everyone for the acts of those who couldn't live by the rules.

> And I am aware of my
>actions if I am in my car or on the mic. I also know the latter does not
>pose a danger.

Who said "danger"? We have restrictions (speed limits) on our freedom of travel not only to ensure it is done safely, but to ensure everyone can travel in a reasonable and orderly manner. The CBRS rules are

much the same. When you key illegal power and disrupt legal users you
can't hear, you've effectively run someone off the road twenty miles
from where you exceeded the speed limit. My point isn't the physical
harm which comes with running someone off the road -- it would be the
denial of their right to travel just because you perceive your needs
to be more pressing than someone elses.

The reason speeding and illegal CB use doesn't compare well for me is
that speeding doesn't result in such unobservable consequences to
others. To me, throwing your trash out the car window would be a
better example. You don't see it, but others have to.

The only way speeding and illegal CB radio operation seem to be
similar is that, as more people rationalize their irresponsibility,
the more reason we have for more intrusive government (photo radar,
speed bumps, Brady bill, EBay ban, etc.).

>:>What about the death, injury and damage to the other persons property?
>:>Illegal CB use poses none of those.
>:
>:You're the one who made the comparison. What about it?
>
>Like I said before there are more serious problems in this country that need
>enforcement and CB radio just doesn't or shouldn't rank high on the list.

Unfortunately all criminals can point to some "worse" crime that
should be fixed before they become the object of enforcement. It is
the nature of criminals.

Mark

You haven't been reading have you? If you had, you would be able to answer your own question. I've said numerous times that I am not a ham; neither am I am an IB'er (Illegal Band). I am a CB'er who feels he has no other choice but to look to ARS due to widespread irresponsible and illegal practices among IB'ers operating on CBRS.

>... You automaticly assume we're bad people because we're
>(cb'ers)

I've only been talking about those who engage in illegal activities and degrade CB for the legal operators. All I've seen from the illegal operators is, "we're not so bad; define what the word 'is' is."

>CB'ER by choice I'll se ya

I'm a CB'er by choice, not an IB'er.

Just as we have a right to share a public resource, I have a right to share the airwaves. Turning off my radio due to your _illegal_ behavior couched as "freedom of speech and religion" is not an option -- just as putting earplugs in my ears when you broadcast from a loudspeaker from your roof is not an option.

There's really no excuse for rampant illegal CB practices. The only possible excuse I could begin to entertain is if the government defaulted on the rules, thereby effectively proving there are no rules. I have a difficult time believing this is the case because, 1) we've just seen an IBer (Illegal CBer) get busted in Texas. 2) The primary champions of the "FCC capitulation theory" seem stunningly absent of any referential evidence which could be used to defend illegal practices. These champions likely point to the rampant proliferation of IBers and illegal practices -- but the fact that CB is dominated by illegal practices and the crooks don't turn themselves in is hardly proof that FCC has actively capitulated.

The best way to justify the rampant illegal CB practices would be to work a real complaint. Unfortunately I don't think many illegal CB operators are anxious to do this because they don't want to *really* find out. It's easier to wave around a story about something that once happened, which doesn't appear to have been pursued, and can't be pursued today except in terms of "so-and-so on the Internet said...".

When you face $10,000 fines (or even prison time[1]) for transmitting illegally, it sure doesn't look that much different. Maybe it would _feel_ different when I'm out $10,000 or sitting in jail.

>>shooting firearms randomly into the
>>air with little regard to what damage they may cause as they fall.
>
>A little harsh, don't ya think

Why's that? it seems almost exactly the same to me. Indiscriminate discharging of firearms, just because "I have a right" is a practice best described as disordered liberty and has the result of denying others their ability to exercise their rights (say freedom of travel as bullets randomly drop out of the sky). It's not to say you might not accidently fire a gun into the air, or that a legally operating CBer wouldn't step on another operator. It's whether we try to minimize such instances by adhering to rules which are designed to promote everyone's orderly freedom. All I see from illegal operators of CB is "it's not that bad, everyone else is doing it, there's worse things in the world." In the end, however, you are showing contempt for your radio service and the legitimate operators of that service.

>>I've yet to understand why these practices are something to be proud
>>of, or rationalized and compared to other illegal practices.
>
>Because they aren't illeagle, they just don't conform to FCC regulation

Can I start transmitting on ARS frequencies? or maybe government frequencies? It's not illegal, right? And I do have a "right to free speech," right?

Can anyone tell me how to make the "matching device" that turns a 22.5-foot pole into a 5/8 wave antenna? I can't seem to get that single-helix with a tap to work. Thanks folks.

True, a retailer can not sell one of these.

> To get that capability the Kenwood or Icom, etc., would have to be
>modified.

An individual can modify his own radio legally. (assuming he is not transmitting with it)

> That modified radio would not be TYPE ACCEPTED for use on the 11 meter
>(CB) band, and thereby illegal to use on that band by anyone. HAM
>operator or non-ham operator.....

True, it is not type accepted, but it does not need to be as long as it is being used as a receiver on 11 meters.

> Since the HAM cannot legally transmit on that frequency on that
>non-type-accepted transciever, and had to modify that transciever to
>transmit there, it would be considered probable that the amateur
>modified the transciever to illegally communicate by using it on the 11
>meter band.

Change the word probable to possible. The FCC can not assume you are doing something illegal on this "possible" scenario alone.

Charles Davis wrote:

> But you seem to advocate some illegal activities on the CB band. Maybe I'm wrong. If so, I apologize.

I don't advocate illegal activities, but then again I don't always try to stifle them either.

I advocate good design, because it makes things better for everyone.

> You actually believe this?

Yes.

> You help, and offer help many times to illegal CB activity.

I offer help to make some illegal and dirty devices run more cleanly.

They are still illegal but at least they are running more cleanly and not generating as much interference for everyone.

I did not help anyone build that illegal amp nor did I sell it, but if I can help someone make it run more 'cleanly' by offering technical assistance, why is that wrong?

> > I believe I have made all the bands better because of what I have posted to this newsgroup.
>
> Maybe you could do more.

I'm catching enough flack for what I have already done!

Where is my incentive to get more involved?

More persecution by you and Mark and HAM's INC.?

> There you go again with the, blame it on the HAMs.

Because it's mostly their fault.

> When we each have cleaned up ourselves, only then should we clean up others.

> I have tried to forsake any illegal radio practices, and except
> for forgetting to ID every 10 minutes, think I have succeeded.
> I have ordered a 10 minute timer to help me with this.

I don't include you as part of the problem.

If you want to see where the problem lies, follow the money!

> If you do not knowingly work, or abet in the work of equipment
> that will be used illegally, I've been wrong. Tell me I have,
> and I'll apologize again.

Equipment that I work on can be used legally or illegally, just as your guns can.

> But you do work on stuff that you know will be used illegally?

No more than any gunsmith would.

>-- I also repair MRI amplifiers, Cell site amplifiers, High Power
>-- Broadcast Transmitters and linear amplifiers, Sputtering Machine Plasma
>-- Generator amplifiers, Iinduction Hardener amplifiers, Vibration Table
>--> amplifiers, etc..., as I legally can with the license I currently hold.
>
> Which has no bearing on what we're discussing.

Sure it does, because many of those amplifiers and transmitters listed above can be used illegally.

There are places where audio amplifiers could be used illegally too!

> It was at one time illegal for you to do so, KNOWING that it
> was to be used illegally.

Not true.

I don't have to ask how the device is going to be used.

> Has this changed?

I don't know.

> Best tech I've ever
> known once showed me that it was illegal for him to KNOWINGLY
> work on equipment that was to be used illegally.

What exactly did he show you?

>-> amplifiers, modifying stock CB radios for more output power or
>-> modulation, or connected is some way or another to the CB activity in
>-> the US?
>

> They are wrong. Period.

So what are you doing to fix it?

As I said, the HAMS should clean their own house first!

> > How about when you talk to your sideband buddies running export radios,
> > or modified radios.
>
> I no longer do this. I have stopped being part of the problem.

But you admit you were a part of the problem until you got 'religion'.

And now you went to HAM.

Maybe there are other newbie CB operators that will take the same route, but if they don't get to follow the same path you did; illegal activities and all; they may get quickly disenchanted and not even stay with the radio hobby, much less become HAM operators.

> Now I'm searching for a solution, that won't penalize the
> decent operator, that has to break the rules, just to get by.
> This is one hell of a dilemma.

I agree.

If you find a solution that is good (and fair) for all, and has a possibility of being accepted by the existing CB and HAM communities, let me know and I will help you champion that cause!

> My radios are legal, and I use them legally.

If you have a non-type-accepted HAM transceiver and it has it's 11 meter transmit enabled you are illegal.

> > Even if you have a type accepted CB radio but also have a linear
> > capable of operation on 11 meters at the same premise, then why
> > shouldn't the FCC make the assumption that you use it?
>
> You're not going to like this. Simply because I have a license
> that allows me to possess an amp capable of working on 10m.

Do you have a license that allows that much power on AM?

And I believe that if you read part 97 concerning HF amplifiers you will find that there are other requirements that must be met for that HF linear amplifier to be legal for HAM RADIO use (unless you built it yourself).

> Just for factory manufacturing, and selling. I can own, and
> modify it to work on 10m.

For 10 meters yes, but it should still have the traps in it to restrict operation on 11 meters, or you have to submit it for wither type acceptance, grant of waiver, or have scratch built it yourself.

And only one a year!

> > If you have an old SB-220 at the same premise as a CB radio it is
> > ILLEGAL!
>
> Nope! Once I obtained the license, it was no longer illegal to
> possess it.

If you purchased that amplifier after April 28th, 1978, and cam with 10 meter capability in it, the shop you bought it from sold it to you illegally.

If you purchased it prior to that date, you are correct.

> Looks like you need to go back, and read it a little closer.

I did.

See above....

> >
> > So those hams with a CB set and an SB-220 at the same premise are all
> > illegal!
>
> Nope!
>
> > Any HAM running an export radio modified to run on 11 meters is illegal
> > because the radio is no longer type accepted, assuming it was in the
> > first place, and no one can legally run a non-type-accepted radio on the
> > CB band, HAM LICENSE or not...
>
> This is partially correct. He can use it on the Amateur bands.

That transceiver could not be legally sold as a ham transceiver with 11 meter transmit enabled; even as a 10 meter ham transmitter.

To get 11 meter transmit capability the HAM would have to modify the legal radio after he purchased it.

As so as he enabled 11 meter transmit in that non type accepted radio I would become an illegal radio because NO ONE COULD LEGALLY TRANSMIT ON IT ON 11 METERS! And it could no longer legally be sold (marketed), even to another HAM!

> This is not the way it works. The rules are slightly different
> as to equipment for HAMS v CBers. Mere possession of a radio,
> by an Amateur, that will tx on CB is not illegal. Using it to
> do so, is.

Then someone had better change those rules because the way I read the rules it would be illegal for any transceiver to be marketed (sold) with transmit enabled on the 11 meter band.

Since A HAM cannot legally transmit on the 11 meter band with that radio, the only possible reason he could have for modifying the radio to enable the 11 meter transmit, would be to illegally transmit on 11 meters!

It would also require a request for type acceptance or a grant of waver from the FCC to have such a modified amplifier legally in your possession.

> I'm not for calling anyone, and turning them in. I really wish
> we could work this out without intervention by the g'ment.

I do too.

But I will continue to rebuke any posts I see made by HAM operators putting down CB operators on a CB newsgroup!

Let them post the on a HAM newsgroup and I could care less, but doing what they are doing on a CB newsgroup is just stirring the trouble pot.

And as you said, it will only end up hurting everyone!

> I'm in real trouble with the whole thing. As a CBer, and an
> Amateur, I catch it from both sides.

Your (our) posts here have been part of the problem.

If you don't want the post stirred; don't hand me the spoon!

Dennis

Stunning. Although I have a different posting on the topic, we're now
back to you telling us what we already knew after asserting that
possession and sale were illegal.

>> I'm glad we agree. I'm not pro-ham and not anti-CB.

Really? I thought you wanted the alleged retard near you to suffer
some kind of penalty if only to have his equipment siezed. Now all of

a sudden you're anti-penalty. Or, did you mean only penalties *you*
agree with and for problems that affect *you*? <wink>

>> As you know, I'm increasingly finding it difficult to consider these

I'm not disputing that. Give me some names and evidence. Or is it
that you don't want things to be escalated, made visible,
scruitinized?

How does this work? Dennis has asserted 11m xmit equipment itself is illegal (although he seems to be back-peddling as of late). You mention the amplifier law. If an export radio is not type accepted (which it isn't) and xmits above the legal limit, is it considered governed by the amplifier law?

> Is this clear enough?

Actually it's not. What you say above don't harmonize too well
together (some seem mutually exclusive). This is particularly
disturbing when you had written strong assertions that the possession
or sale of 11m radios were verboten:

"I think someone should call E-Bay and let them know that it
is illegal to sell a ham transciever that has transmit
capabilities on the 11 meter band because it is not
TYPE-ACCEPTED"
Message-ID: <37040160.8A022699@lucent.com>

"It is not legal to sell a radio that has 11 meter transmit
capability."
Message-ID: <3703F49B.2698AF3F@lucent.com>

"illegal sales of linear amplifiers"
Message-ID: <37051EC9.DE939C52@lucent.com>

Let that 100% legal operator throw the first stone; but I want
permission to check his station to make sure it is totally and
completely legal.
You would be surprised how many might think they are but are
not...

```
     [such as?]
     Any HAM transceiver with the 11 meter band transmit enabled in
     it.
Message-ID: <3703050B.1F3D63EF@lucent.com>
```

We went from assertions that a transmit-enabled non-type accepted radio is "illegal" to possess or sell, to what appears to be a superflous assertion that actually transmitting is illegal.

On top of this, a FCC warning was posted and it was asserted that this proved such radios, when used for receive-only <wink> are legal. See Message-ID: <3706d0c1.4246021@beta1.newscene.com>

Then, in Message-ID: <370526BC.3691B3A0@lucent.com> you say "[a]s long as they can't transmit they are probably legal."

The only reason this disturbs be a wee bit is that I asked you for your reference and received "do your own research" [Message-ID: <37042161.C1C6D389@lucent.com>]

If your assertions are true, I'd sincerely like to know where this is drawn from.

Mark

4o channel base radio. No sideband but does have FM added. 59 extra channels have been added. Radio is a 6.5 of 10 as it has a soldering iron burn on lower right front corner. Everything works great on this radio including the clock and alarm. Comes with hand mike. Price is $75.00 shipped. Thanks for the read! Jon.

One possible problem is that power supplies are usually rated in peak short term amps and not in a more realistic (no pun intended) overall use.   You may need a larger power supply (4.5 - 7 amps)

Next is the possibility that your swr's are too high (standing wave ratio) You may need to check and set them.

Also did you get a base antenna or a mobile whip. Most times a mobile whip wont work very well at a base location and typically you wont be able to get your swr's down (may burn out your finals)
Hope this has been a help.   Sparky at the repair depot

Actually it would go more like this:

FCC guy: "what are you doing with this linear?"

Dennis the Good guy: "It's in for repair, see the ticket on it?"

FCC guy: "Do you have the proper license to do this kind of work?"

Dennis the good guy: " Yes sir, it's on the wall over there for everyone to see."

FCC guy, after examining the license: " Is this linear capable of operating on 11 meters?"

Dennis the good guy: "Yes sir."

FCC guy: "will this linear be used illegally after you repair it?"

Dennis the good guy: "I have no way of knowing that."

FCC guy: " Can you be reasonably certain that this linear will be used legally after you repair it?"

Dennis the good guy: "Well it did come from a CB shop, but the owner and technician both have HAM licenses."

FCC guy: " That doesn't answer my question."

Dennis the good guy: "That may be true, but since they are licensed HAM operators and I am a licensed to repair this type of equipment, they could take me to court if I refused to accept their business, and any additional information I could supply would be purely speculation."

"Why are you here again anyway; did someone send in a complaint?"

FCC guy: " Yah...; some legal - beagle named Mark something or other; you are just one on a list of about 3,652 names that he gave us, along with an ultimatum stating that we had to respond within 45 days or face a senate subcommittee for noncompliance.."

Dennis the good guy: "I know him; that's the guy who blames skip and other interference for his not being able to talk to anyone on any of his radios. I wonder when he is going to figure out that it's just because no one wants to talk to him?"

FCC guy: " That's him all right; a real loser! But we have a team watching him round the clock now waiting for him to make a mistake like not identifying his station every 10 minutes; and when he makes that mistake we will give him one of those court mandated 10X sentences he forced us to start handing out to everyone. That's the one where he will lose his house and car and all civil liberties for the rest of his life!"

Dennis the good guy: " Couldn't happen to a nicer guy.....", "How about a beer?"

Fcc guy: " I'm off duty in 5 minutes anyway, why not?"

Dennis the good guy: " Let's got to Big blue's place; I'll buy the first round."

FCC guy: " OK, but this time you rack and I get to break!"

Dennis the good guy: "You're on!", "Let's go!"

And they march away into the sunset, as good friends, united by the threat of their common enemy!

Dennis

It doesn't take an illegal operator, or operators, to produce skip. Is that what your saying? I'm sorry, sir, but at the moment I find myself to be in a "confused" state....
Yes, I live in California!

The same applies to HAM TRANSCIEVERS modified to transmit on 11 meters.

There is no provision for them to ever be used legally!

Go to court and either get them to sanction the linear or make it
illegal to have in your possession any HAM TRANSCIEVER that has it's
transmit enabled on 11 meters!

Dennis

Mark A. Fuller wrote:

> Wrong. Just as the CB operator's creed is "it's not illegal if you
> don't get caught",

That is also the creed of the HAM operator transmitting on his Kenwood on 11 meters, the speeder going to work, the scanner owner listening to cellular conversations, the store operator with the video cameras in the changing rooms, and the guy carring a pistol for his own protection in the city of Chicago.

> the government's creed is "you can make charges

Now you are showing us the government's, and your own, true colors!

> Of course, you guys will cry like babies that the government doesn't
> follow the rules. Huh, what's up with that?

Sounds like you condone making up rules just to suit your own agenda!

But isn't that exactly what your complaint was with the CB operators?

Dennis

Sorry, but it is not!

Not only does it take a quite expensive unit, but it must be frequently calibrated.

And if the calibration date and the serial number of the measurement device that was used are not present on any complaint received, you should question why.

No.
Yes.
Confused?
So is everyone else.
Ask Mark F.
If you can wade through all the rhetoric, some of his reply may be useful.
Good Luck to you.
Jeff

I agree!

All because they didn't let him talk because they couldn't hear him breaking the channel...

And after all, it was HIS channel wasn't it?

Why not?

Those regs make those things he likes to do illegally, legal!

> We don't need nor want any more law breakers in the ARS;

They you better start cleaning you own house first, and you have a very long way to go yet!

At least you admit to that.

> Hopefully the newly revitalized FCC enforcement
> branch will shut 'em all down, then begin going after the unlawful CBers.

Don't matter which comes first, both houses need some cleaning.

That doesn't make your posting any less out-of-line though, does it?

You are doing exactly what you accuse the CB radio operators of!

Sounds like the typical troublemaker the FCC has been busting lately.

Extra Class Ham with his linear tuned to CB channel #55

Good example to follow!

I understood that, but my question was" were those CB dealers licensed HAM operators"?

> When I decided to purchase a HAM rig, I went to a national
> dealer, and LIED about my purpose for purchasing the radio.

So he, a HAM operator, illegally sold you a HAM transciever capable of transmitting on the CB band, without ever verifying that you had a valid HAM license!

Don't feel bad about it, this goes on dozens of times a day, 5 or 6 days a week, across the USA.

Follow the money trail, find the source of the problem!

> If the existing rules were enforced, the band wouldn't be as it
> is.

I wish I could be such a 'dreamer' but I know better!

If you don't quote me completely and correctly your responses don't count for anything!

I am getting sick of you doing partial quotes that change the meaning of the statement that was made!

If you quote me, do it completely and correctly, or don't expect any kind of a response from me!

Mark , this same phenomenon of running someone of the road as you call it can be achieved , running legal power and a regular antenna or perhaps a thing called" propagation" which the government has yet been able to control, you know like when skip rolls in and you cannot hear the locals over the dx. Or how about on the ham bands where Joe "Extra Class" has a legal limit + station , Alpha 76 Amplifier on stand-by , piped into a Force12 beam, waiting for a VK station to clear, so he can bust thru the qrm he fires that big Alpha legal limit plus on your little old 200 watt station, no one even knows your there , let alone him and he just keyed on you denying your right to the airwaves , denying your travel as you call it . Most people who get on a highway get on with the fact that there may be someone coming down the road faster than they are, so they stay to the right and still travel the road , most people who use the cb know there are other people running power , there will be skip conditions they cannot do a thing about . if 11 meters were a valuable spectrum the goverment would have sold it long ago, It is not a stable band . Talking on the cb with a few extra watts never killed anyone that I know of , it is a hobby for most and it keeps people "off the streets", doing other unwise things , some people are bored or lonely and talking is a good thing for them . I feel that if it doesnt interfere with a neighbor or an emergency something along those lines , let the people do it, Most are good old working people who come home and want to shoot the shit after a long hard day, but you want to fine them $10,000 and put them in jail. Hardly a crime doesnt fit the time case. Anyhow you will come back with some rhetoric you lawyer type are all the same .

>much the same. When you key illegal power and disrupt legal users you

NO it's mine.... Bought and paid for up front...

So everyone has to ask me for permission to talk...

Sometimes the mod gives you both. Just don't transmit.

> I'm curious how you arrived at your "transmit-only"
>prohibition?

It is a violation of the Commission's regulations to:

(1) import or market a transmitter that is designed or intended to
operate on frequencies outside of the ARS bands, if it has not been
issued a grant of equipment authorization for the radio servce(s) in
which the transmitter is capable of operating;

******* Import or market.......a user does neither ************

(2) import, market or operate a transmitter that requires a grant of
equipment authorization but for which no grant has been issued: or,

******* operate a transmitter , I've always said don't transmit ******

(3) transmit on a frequency allocated to a licensed radio service
without the appropriate Commission issued station license.

***************** again don't transmit *****************

 That's pretty much correct.

 What part of my statement was so hard to understand?

> I've already said that I don't care what the legal power limit is: the
> problem is that illegal power users make it worse for legal power
> users than vice versa.

 Everything is relative.

 If you have a legally powered base station and I have a legally powered
```

base station, and we both have beam antennas pointed at each other, it would take one heck of a lot of illegal power to interfere with oou conversation unless that illegal power was located somewhere between us.

If that did happen that the illegal power was between us, we could affect his receive just as much as he was affecting ours, and he would become quite unconfortable with that situation (unless he was there exclusively to jam our communications) and want to find another clear channel just as much as we would have wanted him to.

>- > Rules, like contracts, can work both ways...

Yes.

The lawyers!

> > Can you prove it?
>
> What was the incident in this thread which you responded to?

The one where you got stepped on.

> > Those truckers don't need to run anything more than a stock radio with

THEY is a pretty broad term!

> I understand what you're
> saying about legal power -- but it gets all the worse when they're

> even further.

True.

> > Remember, those truckers were completely legal based on the current
> >part 95 rules!!!!

>
> Even though they said they were using Galaxy 99s?

No, but in my scenario they were using stock radios, remember?

I was just trying to point out the fact that it does not make that much of a difference if they run a hot stock Uniden, or a export Galaxy radio....

They will still plug your ears!

> That's the problem, nobody decides. We end up with blanket laws which
> impact everyone including the legal users. Look at what happened at
> Ebay.

That was expected!

Look at the ones who were cross posting to advertise their stuff on e-bay

They had HAM callsigns at the bottoms of their posts.

My guess is that someone got tired of the spamming and knew what they could do to make it stop!

That's fine with me!

> How can the problem be the same when they run 4w compared to 15w?

Because if the square of the power VS distance law.

The difference in range between those two power levels would not be that great!

> > A few truckers traveling together using stock radios can go a heck of a
> >long way when they are on the elevated sections of the Chicago

No that's not true.

My problem with some of your statements is that it would require expert opinion to even be correct half the time on some of the assumptions you have made, and I don't believe you have enough experience yet to be able to do that.

> >and last but not
> >least, you don't know if it was a licensed ham on 11 meters or an

> users.

It would have everything to do with it because if the radio that he said keyed on him was not an illegal one, he would not have a leg to stand on, because of the 'acceptance of interferrence' clause that goes with part 95!

> I have no idea if he was "justified" in doing so because he
> needed to talk further than the legal limit would allow.

You are making assumptions that he was using illegal power levels but cannot prove it.

> Only that
> had we been running the same power he would have been more likely to
> have heard us and either waited, QSYd, or called break.

You are assuming he had his radio unsquelched!

I wish they would make it illegal for a radio to have a squelch control for exactly that reason!

> > It could have legally been a HAM rag chewing on 10 meters and you were

> >local signal on another frequency.
>
> That could be, but I didn't hear a call sign.

Were you listening for at least 10 minutes?

> > Guilty by your innuendoes again, huh?
>
> No, simply pointing out that your old tired saw about this event the
> FCC didn't deal with didn't seem very important if you didn't keep
> copies, get certified receipts, and escalate. <yawn>

It wasn't.

That man had no impact on me.

But he destroys the communications in a 15 mile radius from where he lives in Westmont, Il..

I didn't believe the local storys about the lack of FCC action, so I took it upon myself to try to do something, and I was also ignored...

> Get me the complaint number or something other than "so-and-so said"
> which I can work with and pursue. I will if you'll just get it.

I'll see what I can do.

> > What options would you propose that would not fall into any of those
> >broader categories?
>
> Escalate?

to who?

When I got no answer from the local office and one day the call was transferred to the main office, wherever that is, I thought I would have better luck; I didn't!

> > I say you should identify 'THEY' and find out if 'THEY' are really who
> >you think they are...
>
> I refer to them as IBers. Illegal Band.

And I think that is an unnecessary put down.

> I don't think it's good to
> refer to all CBers as "they" since they clearly aren't all engaging in
> illegal practices.

So you call them all IBers?

It sounds like you are calling all CBrs, IBrs.....

> Would you like to use the same specific
> descriptions in referring to hams? :)

No, because it only tends to confuse the issue even more.

> I responded to your non sequitur, and you respond with a non sequitur.
> Lovely.

Thank you!

> I'm still not convinced the FCC can't do something. Hopefully we will
> be testing this soon.

I won't hold my breath if it's ok with you.

Sorry, but I can never tell if you are being sarcastic or straight...

I got it from a hard copy of the rules and regulations part 97, but you should be able to do a search on an FCC web site somewhere and find it.

When the HAMS lost the 11 meter band.

Some time in 1978?

NOT!

Wrong type of TYPE ACCEPTANCE!

NO HAM TRANSCIEVER IS TYPE ACCEPTED fOR TRANSMITTING USE ON 11 METERS!

It can't be type accepted because it's input power to the final is to
high and there is no way to limit the power output to 4 watts!

> You may be referring to the famous Amplifier Law.

I have at times, but this is different!

> Q. What does Type Acceptance mean?
> A. Type acceptance is an equipment authorization granted by the FCC. It is

The keywords here are will be used in the proper manner of service for
which it has been accepted!

they are not type accepted for use on 11 meters!

> K5PF
> "No agenda. Just accurate information."

And I just tried to make your information a little more accurate!

Well maybe he thinks that they are the ones most in need of redemption!

> I would feel the same about anyone who broadcasts to no person in particular.

I would too.

Kinda like Mark trying to talk on the CB when no one is listening!

> I
> believe (thanks to an informed member of this ng) that is not acceptable.

And whoever that was thet told you that was probably correct.

> Cb's are not
> meant as a platform for someone to preach nonstop.

I agree.

The can preach for 3 minutes straight, then they have to unkey for a
few minutes, then they can key again and preach for another 3 minutes,

etc.,etc.,...

 Good luck trying to get help from the FCC.

 You might have better luck trying to get that guy committed.

Dennis

Close.

Modifying your own radio for recieve ONLY on 11 meters is legal

Modifying it to transmit on 11 meters is illegal since it would be an illegal act to transmit on it!

I'd like to be able to agree with you, but unfortunately I can't.

In this area the HAMS call them their HAM 'TICKETS'!

  Modifying is different than operating. A 767 comes with an emergency
switch inside. This is not illegal. The info came straight from the
horses mouth. Charlie horse.

This could be an excellent price if the unit is clean and in good working condition with a recent calibration sticker.

your lucky that you did not buy there junk i bought a radio from them and inside
the lid was the word junk. it would not rec. they took 3 months to send back my
money and they acted like they where doing me a favor. everyone should stop buying
from until they change.......

Check Sams Photofact. Some of those hygains are the same chassis as a
midland 13-857 if I remember it right. It was also used in some kraco
cb radios. Mike.....

Show me proof that they actually collected that $10,000.00 and I'll buy you lunch!

And if they don't collect that 10K in a reasonable amount of time, (45 days?), then you buy me lunch!

Is it a wager?

nice try but maybe english would work better.

i may have a schematic for the 139xlr, but you're needing a translater
'cause i'm just guessin'

 Yes, the modification is in preperation for the illegal act!

 Well Charlie better get a new horse!

 If the HAMS can get away with that, then how can the guy be busted for
the broadband (10 thru 80 meter) amp?

 It just don't make any sense to me!

Unless they had previously agreed to accept all that stuff that was violating their rights as a requirement to do something else they wanted to do.

> Could you quote the relevant section from part 95 which says legal CB
> operators agree to accept interference from non-type accepted radios,
> or illegal linears?

No.

It doesn't use those words, it says interference from ALL sources.

> That is what is a crime, and it is what seems
> fairly serious in potential penalty.

It is not a crime.

> Just because CB operators accept
> interference from legal operators does not sweepingly justify or make
> minor the illegal acts of IBers (Illegal CBers).

No.

They have agreed to accept interference from ANY source!

That's pretty all encompassing!

> I noticed you said illegal "dirty linears." Do you try to talk folks
> out of illegal "clean linears"?

Not usually.

If they are going to buy one I would rather have them buy a clean one.

> > You are very close. Remove this text from your last sentence:

No that's not it at all..

Remove the words I specified and concatenate what remains and read it again.

Then you will understand.

> In my area the illegal behaviors are prevalent. I believe those
> operating illegally are a minority compared to those possessing CB
> radios. But those operating illegally are operating far more often
> than everyone else. It is in fact rare to hear someone say they have
> a type accepted radio and/or not running a "footwarmer".

But that doesn't have any relevance since we got to this point only because you misunderstood the prior sentence and the meaning of it.

And that was because you didn't follow my instructions to remove those words.

Instead of removing them, you concentrated on them!

And spun off on an irrelevant tangent again!

Try it again and see if you can do it any better this time!

Dennis

Oh he's full of it....... He knows nothing about C.B.s,
nor does he no anything other than what he can read on
the web about rules and regulations.
  All he is some whining individual from Phoenix Arizona,
that's pissed off because his neighbors radios bleeding
all over him and the F.C.C. won't do anything about it.
  I say let him get his Ham ticket, maybe it will get
him out of our hair for a while.

It specifically says "operate a transmitter" If you don't key up you
are not operating a transmitter.

>In the case of a non-ham, they would have no possible place to operate

>which was a frequency they excluded from type-accepted requirements.

The key word in everything is transmit. A modification done by
lowering a rapidly moving hammer onto the radio would be a mod,
and according to you it would be illegal. It is not. The only thing
that is illegal concerning mods is using that mod to transmit.
Potential transmit and transmit are not the same.

>Finally, I think there's a great deal of reason to consider this

> Thanks for giving me permission to pull up your posts for the past year. I would not have done so unless you suggested it. I only looked as far as the past month or so.

You are welcome.

> Most of your posts deal with RF. My assumption that you have given advice on how to mod radios to get extra channels was wrong. For that, I apologize.

Apology accepted.

> I see by your posts that you specialize in RF amplifiers.

It's my hobby.

I also hold a license that allows me to work on them.

> I'm reading one right now where you advise a fellow looking to build a 1000W illegal 11 meter mobile transmitter to opt for a 600W illegal transmitter instead. In it, you specifically recommend that he drive the illegal amp with an illegally modified ham transceiver.
>
> It's pretty embarrassing. I won't post it here unless you demand I do.

I think you need to, because I believe you are tainting the words to suit your purpose.

If you do post it, please post it complete and unabridged, and also post all the other posts in that thread so that everyone here can judge for themselves!

I am not ashamed of any posts I have ever made relative to amplifiers.

Even if your 'interpretation' of what was said was true, and I was able to convince someone to use a 600 watt amp instead of a 1000 watt amp., I have improved things for everyone. Because if I hadn't gotten involved that man still would have purchased an amp, but it would have been a much more powerful one and a much dirtier one!

You are just reinforcing my position, and when you feel you have read enough of my posts to prove that fact to yourself, I hope you will once again be big enough to admit you were wrong and post another apology here on this newsgroup!

Have a good weekend!

Dennis

NOT A SINGLE ONE....... Got that, not one. A matter of
fact, I'm going to put a down on the 2003 Harley Davidson
Fatboy 100th anniversary Edition I'll give the baby the

Honda when I'm done....
   Also the baby room monitor is going to have a Davemade
amp hooked up to it so I can hear if anything is wrong
from most anywhere in town.

The cool thing about rules is that they don't have to make sense.
When nonsense can be used to your advantage then use it.

His name is :

Edgar A. White

136 N. Hudson
Westmont, il.
60559-1626

Does that callbook list have names of 'former' HAM operators also?

Ones who may have LOST their licenses?

I would check that list for his name....

Typical excessive dribble snipped

Keep the drag set right Dennis, he's hitting
the lure about 3 to 4 minutes after it hits the water...
It just shows you can catch fish anywhere, as long
as you have the right bait......

That it is not unique to CBrs to have such a 'creed'.

And a licensed HAM operator is not just another CBer, he is supposed to know better!

Mark, you just don't get. We just don't give a damn about the governments idea of how we should live our lives. Especially one that can allow a whore monger to be its president. Now if we could all just ban together and stop paying taxes until we truly have representation of the people again.

Mark A. Fuller wrote in message <370738f4.82906259@news.primenet.com>...

:<lndshark@ix.netcom.com> wrote:
:>No I'm sorry thats Bullshit.... If you broadcast on a loudspeaker
:>on your roof that disturbing the peace , because you can't limit the
:>volume to your neighbors. But on the airwaves you have the option
:>to turn it off if it bothers you, not like it being over open
:>air.
:
:Just as we have a right to share a public resource, I have a right to
:share the airwaves. Turning off my radio due to your _illegal_
:behavior couched as "freedom of speech and religion" is not an option
:-- just as putting earplugs in my ears when you broadcast from a
:loudspeaker from your roof is not an option.
:
:There's really no excuse for rampant illegal CB practices. The only
:possible excuse I could begin to entertain is if the government
:defaulted on the rules, thereby effectively proving there are no
:rules. I have a difficult time believing this is the case because, 1)
:we've just seen an IBer (Illegal CBer) get busted in Texas. 2) The
:primary champions of the "FCC capitulation theory" seem stunningly
:absent of any referential evidence which could be used to defend
:illegal practices. These champions likely point to the rampant
:proliferation of IBers and illegal practices -- but the fact that CB
:is dominated by illegal practices and the crooks don't turn themselves
:in is hardly proof that FCC has actively capitulated.
:
:The best way to justify the rampant illegal CB practices would be to
:work a real complaint. Unfortunately I don't think many illegal CB
:operators are anxious to do this because they don't want to *really*

:find out. It's easier to wave around a story about something that
:once happened, which doesn't appear to have been pursued, and can't be
:pursued today except in terms of "so-and-so on the Internet said...".

:
: Actually it would go more like this:
:
: FCC guy: "what are you doing with this linear?"
:
: Dennis the Good guy: "It's in for repair, see the ticket on it?"
:
: FCC guy: "Do you have the proper license to do this kind of work?"
:
: Dennis the good guy: " Yes sir, it's on the wall over there for
:everyone to see."
:
: FCC guy, after examining the license: " Is this linear capable of
:operating on 11 meters?"
:
: Dennis the good guy: "Yes sir."
:
: FCC guy: "will this linear be used illegally after you repair it?"
:
: Dennis the good guy: "I have no way of knowing that."
:
: FCC guy: " Can you be reasonably certain that this linear will be used
:legally after you repair it?"
:
: Dennis the good guy: "Well it did come from a CB shop, but the owner
:and technician both have HAM licenses."
:
: FCC guy: " That doesn't answer my question."
:
: Dennis the good guy: "That may be true, but since they are licensed HAM
:operators and I am a licensed to repair this type of equipment, they
:could take me to court if I refused to accept their business, and any
:additional information I could supply would be purely speculation."
:
:"Why are you here again anyway; did someone send in a complaint?"
:
: FCC guy: " Yah...; some legal - beagle named Mark something or other;
:you are just one on a list of about 3,652 names that he gave us, along
:with an ultimatum stating that we had to respond within 45 days or face
:a senate subcommittee for noncompliance.."
:
: Dennis the good guy: "I know him; that's the guy who blames skip and
:other interference for his not being able to talk to anyone on any of
:his radios. I wonder when he is going to figure out that it's just
:because no one wants to talk to him?"
:
: FCC guy: " That's him all right; a real loser! But we have a team
:watching him round the clock now waiting for him to make a mistake like
:not identifying his station every 10 minutes; and when he makes that
:mistake we will give him one of those court mandated 10X sentences he
:forced us to start handing out to everyone. That's the one where he
:will lose his house and car and all civil liberties for the rest of his

```
:life!"
:
: Dennis the good guy: " Couldn't happen to a nicer guy.....", "How about
:a beer?"
:
: Fcc guy: " I'm off duty in 5 minutes anyway, why not?"
:

Been a long time since I have done this so I don't rember the numbers but this is how I figured it out. What you are doing is adding enough coil to the bottom of the 5/8ths to make it look like a 3/4. Given this you know that the wire at most wil be 1/8 wl long or about 4.5 ft. Since it is coiled you know that it will be less than this. you can put the coil in series with the antenna and feedline and keep triming the coil until yo uget a decent match, the best SWR you will get like this is about 1.5:1(not too bad). Ideally you want to ground the bottom end of the coil and then tap the feedpoint up on it at a place that matches 50 ohms. This can be a lot of cut and try. Hope I got ypu into the all park with this

Mark asks an excellent question:
>
>How does this work? Dennis has asserted 11m xmit equipment itself is
>illegal (although he seems to be back-peddling as of late). You
>mention the amplifier law. If an export radio is not type accepted
>(which it isn't) and xmits above the legal limit, is it considered
>governed by the amplifier law?
>
>

The export radio is covered under the CB rules & regs, which dictate that equipment in this radio service must be type-accepted. In addition to power limitations, type acceptance hinges on being able to vary the frequency in a manner other than "channelized" switches. (In CB slang, the radio operator cannot be able to "slide" in order for a radio transmitter to be type accepted).

Export radios are legal on 10 meters. They are not legal on 11 meters because of the lack of type acceptance.

I think the light just went on for me. You say modifying your own radio is legal, but only for recieve. You then jump to "transmitting is illegal." I think this jump isn't sustainable.

The FCC notice says (my numbering):

i Some manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users...

ii Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use.

iii The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required because of the simplicity of modifying them to extend their operating frequency range.

iv It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio servce(s) in which the transmitter is capable of operating...

v (2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued: or,

vi (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission issued station license.

What stands out to me is the notice enumerated conversion kits which allow users to modify their radios. It then goes on to "remind manufacturers and users" of the requirement for type acceptance. It then says it is a violation to import or market a transmitter that is designed to operate in a non-type accepeted range.

Doesn't this more than imply that even user modification is illegal? If a user modifies their radio to another service do they not fall into realm of both user and manufacturer? They are enumerated as a party put on notice, and they are doing what the manufacturer is also put on notice for.

In support of this interpretation, in (v) it says it is illegal to import, market or operate a transmitter that requires type acceptance(?) but which lacks it. It does _not_ say "transmit" on a restricted frequency requiring type acceptance. It simply says "operating a transmitter that requires type-acceptance". The moment the radio is converted to 11m, it requires type-acceptance regardless of what frequency you actually transmit on.

I believe the above point is supported by (vi). This condition of violation seems to be added because, earlier in the notice, FCC spoke of ARS-capable radios not requiring type-acceptance. Had transmission been the issue at stake in (v) the authors seem capable of using the word.

It's also worth noting that Hams don't seem to be exempt from this interpretation. This notice exempts ARS radios from type acceptance, but doesn't exempt hams from the requirement of type acceptance for all other frequencies requiring it.

This was very informative and I think I now understand what Dennis was saying. I'm curious how you arrived at your "transmit-only" prohibition?

Maybe you should take a look at:

Message-ID: <19990322085616.00960.00000018@ng61.aol.com>
staradio77@aol.com wrote:
FCC has regulated the sale of linear amplifiers on eBay. The
auctions are being cancelled and completed taken offline.
According to FCC Rules (Section 95.411) CB Rule 11, "It is
illegal to use any type of Linear Amplifier on 11 meters".

Are you claiming the FCC reportedly regulated the sale of linear
amplifiers because CB operators *never* illegally use them?

Or, how about:

Message-ID: <6KuK2.59$_t4.1476223@elnws01.ce.mediaone.net>
kevski@hotmail.com wrote:
Yup, whoever thought that eBay would just ban "CB" amps...

Someone believed Ebay might ban on "CB amps"? why would that be?
because they are widely used illegally on CB?

Or maybe:

> Message-ID: <%NEK2.177$z5.3305757@news1.i1.net>
> tempola@i1.net
> "these illegal linear amps those $^%*$%$#% CB"ERS are
> selling"..........Now e-bay won't accept any type of RF amp...

It was asserted that a ham operator uttered those words in order to get eBay to ban amp sales.

All of a sudden, after hams being blamed for informing on illegal CB users, you're suddenly taken aback that I would refer to illegal CB users as playing a part in the recent eBay decision? Did you get confused or something?

about "Low SSB power on Washington" from '"Pedro"
<senorpurpl@hotmail.com>'. The Keyboard responded with this:

:+> I have a Uniden Washington, stock (cut the limiter once but put it back
:+> because it sounded like crap which I thought it would) and on SSB with a

:+> D104 (10dal head) I only get about 3-4 watts peak speaking very close to
:+> the mike.   Anything I can do about this?? thanks!!!!!

Check ALC control [VR11].

When you cut the limiter, what was the SSB wattage then? [12 - 16 watts? Then the ALC VR-11 is the culprit]

Since I don't know what type of meter you were reading this on, only 4 watts does sound low.

Check bias for both Driver and Final.

The process can be a quick check. It's easier than checking mA drive, the TP7 for Final, and TP8 for Driver, require the use of an ammeter, which not everyone has.

Measuring from board ground, not chassis case ground, to base lead, of driver transistor.

Orient the radio, front facing you, component side up. Locate VR9 [Driver bias] and VR8 [Final Bias].

Use a dummy load on the antenna jack at the radio, select LSB mode, mic gain control all the way down, no audio.

Board ground - any metal can for tank coil cases works well.

Driver [C4960] or [C2166], TO-220 case, base lead is [front face of transistor facing you leads down] furthest to the left, 1 st leg on left.

Test probe this lead for positive, and negative to board ground on a DVOM set for 2V reading.

Key up radio [remember no audio and use a dummy load]

Check voltage at this leg. It should be about .6 volts, if not, adjust VR8 [Driver Bias] to read this. There is a sharp cutoff, so adjust it to where the cutoff occurs [CCW], then back the control up until it reads .6 volts [CW].

Do the same for the Final, only adjust VR8. Pinout for the 2SC1969 is the same, leftmost leg [front facing you, leads down] is base.

Set base bias to .6 volts, or for more accurate, .677 volts. This can be verified by checking mA drive on the TP's - both should be between .6 to .7 mA of idle current.

Once these are set, then remove test leads, and using the dummy load, adjust VR11 [ALC] using full mic gain [all the way up] and use the "Ahh-h-h" sound, adjust VR11, watching the meter for full deflection, or rise. Once the highest rise has been obtained, and turning VR11 can't get any more out of it, back the control [VR11] back to the point where the highest wattage reading starts to go back down. This point as about the max you can set VR11 and still have ALC control.

I'm figuring the ALC was set a little too low. If you still have only 4 watts, then the problem can be traced back to TR41 [2SC1419] and or TR42 [2SC945]. If TR41 is bad, replace with a 2SC1012 or a NTE-153, but I prefer the NTE-264 [Darlington PNP].

Hope these ideas help.

:+> is illegal." I think this jump isn't sustainable.
:+>
:+> The FCC notice says (my numbering):

You're forgetting one special point.

Sales of these radios, are covered by warranty.

Once the radios have been modified, the warranty issue can become null and void. Therefore the operator must pay for any and all damages done to the radio, and the subsequent re-alignment and adjustments needed or required to meet the conformity standard the device was originally imported as.

The warranty issue depends on the company honoring it.

Some simply do not offer a warranty if the owner tampers with it.

Some offer to repair the radio, if damages done to the radio are not the fault of the modification, or abuse by the operator.

Some don't even bother acknowledging the fact that the radio was theirs.

These three issues, accumulate to one basic premise.

If the operator decides to modify the radio. Once that is done, the operator then assumes all responsibility for problems with it.

It's the operators responsibility, not the manufacturers.

If the manufacturer offered a warranty, 10 times out of 10, that warranty is voided if the operator did perform mods to the radio. This then places the operator as the fault, not the radios.

Whether the radio was able to perform after these mods were done, is not of consequence. If the radio fails, the operator is responsible, not the maker.

The maker is only responsible for the radio in it's stock form arriving to the operator, or dealer, in the specified condition that allowed it's passage into the hands of either the dealer or the owner.

IF the owner or dealer modified it, the only person that has sole responsiblity, is still, the owner. The owner made the choice, and if applicable, the dealer simply did what was requested.

Amateur ops have more to lose due to this.

Let me put it this way.

I can buy a Chevy Chevette. I then place 4 miles on this brand new vehicle, just to get to "Freds 'furbished FORDS".

I request they remove the 4-L engine, and replace it with a V-6 or a V-8.

Does that mean the dealer I bought the vehicle from is responsible for fixing the vehicle under a bumper-to-bumper 12,000 mile warranty?

They don't.

Why?

They didn't put that engine in there, you did. Any problems from the moment you placed that engine in there, and from then on. They are your problem, no one elses.

It says a lot for both CB'er and Amateur alike.

When it comes to complaints or violations, it's on an individual basis, not an entire group.

Don't lump good CB'ers with Bad ones, then we won't bunch the lot of Amateurs as being bad either.

You can quit with the stereotypes at any time.

Regards!

Hey listen here you jerk, maybe you just might want to take a frickin look at my last post, the only thing wrong was an apostrophe in the wrong damn place. Also maybe YOU did not read!!!!! I replied to someone who called you're damn ham license a "Ticket." If I'm replying to a troll SO THE HELL WHAT!!!!!

I don't disagree, Dennis. I was simply making the point that 11 Meters *is* HF.
 You are correct when speaking of equipment for other radio services, including
(but not limited to) ham gear.

That last sentence sums up the point I've been making. We would more likely hear him and not inadvertantly drown out his communications. If you and I run illegal power it is more likely we will hear each other but not the legal users. In the meantime we're creating x times more QRM. That doesn't mean legal power is always perfect, only that the imperfections don't justify making the playing field uneven and thereby even more imperfect for the legal users.

Exactly. I gave that story. You said you didn't like it when it happened to you. I said it's illegal and you asked if I could prove it. The guy who stepped on me said he was running a RCI. That's illegal. If you don't believe the story it would have been easier to say so initially.

In reality they don't and just because legal power wouldn't be perfect doesn't mean it wouldn't be better than illegal power. That is to say, while I agree with you that a dozen trucks bumper-to-bumper talking 5 watts with their RF gain turned down aren't going to hear someone 3 miles away -- it is still better than a dozen trucks, half of which are running 15 watts and bleeding due to poor mods, with their RF gain turned down and not hearing people 9 miles away who are running legally but can hear the trucks.

Capice?

I don't know what to tell you. Someone said they were running an
illegal RCI (perhaps with a "clean" illegal linear) and they appeared
to not have heard two legal CBers. This is very much like what you
said leads to CBers turning to illegal power.

Has anyone tried this antenna yet???
Is there anyone who tested it??? I purchased one just to see if it really could get close to holding the 10K they said it could. The other main reason is I thought it would be real good because of it's short length to ride around town mud ducking but, still being able to hold the watts. I bought the 3 foot nightstick.
Well barefoot it tuned up real good but, when I put 400 bird watts in it well the reflection went up to and I believe I burnt it out. Everyone outside of the van could hear me in the parking lot through my antenna and it was real loud. They waved me to come out so I keyed it again while looking at the antenna. It was arching and sparking at the tip of the nightstick and again I could hear my audio as loud as can be. After that I took the antenna down and the metal tip was burnt.
Did I burn the antenna out with 400 watts??? Did I get an inferior antenna?? Any ideas??? It was only 12 dollars so I guess the investment wasn't too bad!!!!
Does anyone out there know of any smaller antennas in the 2-4 foot range that can really handle 400 bird watts???

Thanks,

ICE, ICE & More ICE..... Mr. ICECOLD Big Apple Trees Just hammered down!!!!!

Yes, I agree. Doesn't that pretty much put the kabash on all these CB
retailers (whether they're hams or not) who sell "export" and ham rigs
modified to transmit on 11m? Wouldn't it also impart some
ramification for eBay?

>(2) import, market or operate a transmitter that requires a grant of
>equipment authorization but for which no grant has been issued: or,
>
>******* operate a transmitter , I've always said don't transmit ******

My point was that this one doesn't say "don't transmit on frequencies
where type acceptance is required." It says you can't operate the
transmitter, period. Doesn't this clearly make ham radios modified to
operate on 11m illegal for use on ARS?

In the case of a non-ham, they would have no possible place to operate
the transmitter. So #2 doesn't affect them. However, a ham does have
other areas to operate and this clause seems to say the xmitter can't
be used anywhere.

>(3) transmit on a frequency allocated to a licensed radio service
>without the appropriate Commission issued station license.
>
>***************** again don't transmit *****************

That's what is deleterious to #2. Had they meant "don't transmit" on
a specific prohibited frequency they apparently seemed to have the
means to say it since they said it in #3 (regarding ARS specifically).
It causes one to wonder why they chose "operate a transmitter" in #2

without reference to *any* of the bands they enumerated as problematic for non-type accepted operation. Then they say "transmit on [ARS]" which was a frequency they excluded from type-accepted requirements.

Finally, I think there's a great deal of reason to consider this notice as prohibiting modification of the transmitter by the user regardless of whether they ever operate the transmitter.

The notice clearly concerns "frequency expansion" and addresses "Manufacturers, importers, vendors and users of these transceivers". Why would the FCC prohibit manufacture, import, vending and marketting of non-type accepted radios but not have a problem with users effectively doing what manufacturers, importers and vendors can't?

That wouldn't make a lot of sense. Logically, however, they'd never know unless you're caught transmitting and they'd likely push that angle. But it seems obvious that the intent of the notice is to prevent possession/proliferation of such radios.

I did a search on part 95 for "interference" and "source." No hits.
Any more suggestions?

The FCC Notice concerning illegal frequency expansion and non-type
accepted radios says "criminal penalties".

However, he keys up his illegal radio and he's welcomed into the brotherhood of illegal practices. I agree with you that he should know better and I would support 10x the penalty for hams operating illegally on CB. But, ultimately it is CB with the illegal practices and the creed.

Unfortunately that's exactly what seems to happen. I can't think of to many (if any) instances of increasing disregard for laws (or non-enforcement of laws, which seems to go hand-in-hand) which didn't result in less freedom. I could easily see us in a situation where you have to present your ham ticket to purchase non-cb equipment. Like the 4473 "yellow" forms for purchasing firearms, some people will "lie" and when it becomes prevalent enough (in conjunction with under-enforcement) we'll have mandatory ham-license "instant check".

However absurd this sounds, and however much under-enforcement plays a role, it always seems to be a losing game.

I agree. What it doesn't say is "operate a transmitter on a frequency where the transmitter must be type accepted." I was under the impression that because hams could modify their radios and ARS didn't have "type accepted" requirements, that a ham could modify a radio for 11m, never transmit on it 11m, and continue to transmit on ARS frequencies.

This FCC notice indicates once a radio needs to be type accepted, it can't be transmitted period. The non-ham would have no other band to xmit on, so this distinction may seem superflous. A ham on the other hand would have a radio which couldn't be xmitted on ARS either.

>Potential transmit and transmit are not the same.

If that were the case then they wouldn't have addressed manufacturers, vendors and marketers. The only one who will transmit, as opposed to potential transmit, is the user. The notice clearly prohibits all types of non-transmit activities prior to the radio reaching the hands of the user.

>Who said they had to be logical. They did not specify users.

The entire notice is about keeping non-type accepted radios out of the hands of users. If I take your reading I would have to believe a user can modify the radio, but would break the law upon selling the radio (marketing, vending). That wouldn't make much sense.

I was pretty much with you until this one. What if the ham wanted to receive the CB and free bands, and there was no practical way to enable extended receive without also enabling extended transmit?

Ford makes a fuel pump filter. I don't have the model number (maybe someone on the NG does). You can try www.alldata.com to see of there is a TSB for your car. The TSB listing only goes to the 1998 model year. If you have trouble finding any info, ask Ford service to look up "TSB# 9637 Fuel Pump Buzz/Whine Through Radio Speaker" for a 96 Mustang GT and see if that filter/fix can be applied to your Mercury.
Good Luck,
Steve.

If your sure it's the power supply, there may not be much you can do. The Samlex 1223 is a switching supply. Switching supplies can generate RFI. You could try a filter, locating the radio away from the supply or playing with different grounding combinations.
Steve.

<<I am not ashamed of any posts I have ever made relative to amplifiers.
please post it complete and unabridged, and also
post all the other posts in that thread so that everyone here can judge
for themselves!>>>

Dennis,

It's pretty clear to me (from the post below, and similar opinions you have expressed in this newsroup) that you feel that using illegal CB amps on CB frequencies are okay, as long as they are run "cleanly".

If that's your opinion, you should admit to it. Or maybe you have admitted to it already, and I'm just not hearing it.

Nonetheless, it's my right to hold and express an opposite opinion from what (I think) yours is.

My opinion is that - "clean" or not - amps are still illegal - and still cause interference to other CB users - and still contribute to making the band worse for everybody.

Furthermore, it's my opinion that when you (Dennis) advise someone (like blueradio@usa.net) to buy a Texas Star Amp and drive it with a ham transceiver (!), you are indirectly contributing to putting another [illegal] high-power signal on 11 meters that other users will have to contend with.

And perhaps by reading your advice to "blueradio@usa.net", people who have never considered getting an amp might be influenced to acquire a Texas Star [illegal] amp of their own.

Or a newbie who thought all amps were "dirty" now gets the idea that he can run an [illegal] amp -- as long as it's clean.

Please, let's not go down a sidetrack about the vast conspiracy of hams that are at the root of the problems that plague the CB service. Or the fact that there are worse illegalities than the ones we're talking about. I know that hams sell amps to CB'ers and I disapprove of it. And I know that drugs and crime are far worse problems than illegal amplifiers. But those issues are just distractors.

The issue at hand is that a person with your obvious technical expertise is taken seriously in a newsgroup such as this. Because of that, your opinions have consequences, whether you want them to or not. Look, nobody can stop you from expressing your opinions, least of all me, and I would not want to. But what I am asking is that you seriously consider that you may be helping to perpetuate the increasing use of, and resulting problems arising from [illega] amplifiers used on 11 meters.

Joe

What you are looking for doesn't currently exist in the US market.

The Texas Star DX1600 (sweet-16) comes closest to what you are looking for but it does not provide variable power or output filtering.

It would also need a little more than 4 to 5 watts drive. (although 4 watts should get you a dead key of about 150 watts peaking at 600.....)

blueradio@usa.net wrote:

> Dennis,
> Is texas Star making those now?

I believe there are folks on this newsgroup that could help you find a new one.

> or would i have to go for a used one?

There are some very nice used ones around also...

> Well i can always add the filtering external. not a problem.

External is never as good as internal.

But with a 'clean' amp like the 1600, (as long as you put a clean signal in and don't overdrive it), you should not need much, or any, filtering....

> in the dollar range that i'm talking I could always drive it with a higher
> power radio like an rci29xx keeping me from needing a driver amp.

I would rather see you drive it with a HAM transciever if you want 'clean' operation.

> or run a
> driver amp with variable power.

That doesn't usually work out to be a 'clean' solution; and creates too many additional problems.

The DX1600 does not need all that much drive if you want to keep it running clean.

20 watts in with 100% modulation will probably get you a 400 watt dead key and 1200 to 1600 watts peak depending on the supply voltage you can hold under load.

> Guess I should lower my goals a hair.

Don't lower your goals, they are good ones!

> But i still want to go class ab, run clean,and dead key around 500w.

You will have to find a DX3200 (Silver Bullet/Viking) model if you want a 500 watt dead key with clean peak audio (2000 watts peak or so).

I would start out with a DX1600 and if you need more later, sell it and upgrade.

The Texas Star amps hold their resale value as good as or better than other CB amps.

Since I don't sell any amps myself, you know that I can be completely unbiased with my recommendation...

Have a great weekend!

Dennis

I just happen to have what you are looking for. VR 13 and VR12 are your SSB and AM pots. cut R249 and replace R238 with a 1 meg ohm resistor.....that should just about do it. There is another mod, but it won't get you much more that these mods will. When you replace R238 you may have to run you mike gain lower than previously as it opens up the adio circuit.

73's and have a happy Easter.

If any of you have the Golden Eagle base tube amp, like the one I use to have, that came with the 27lf6 tubes, I have found a place on the web that claims to carry both new and used 27lf6 tubes. The prices they listed were $32.00 for new and $16.00 for used. If you want their web site address, just drop me an email and I will gladly send you the info....I am in no way connected with this company that has the tubes, I just remember how hard they were to find when I had one of those beautiful black boxes.......73.....Tom

Hello, I have FOUR of these in excellent condition, extreme low-hour use.

All getters are as shiny as new.
They are all identical Sylvania, and match very closely.
Selling all four as a quad only, 150.00 includes shipping in cont. USA.
Thank you,
Joe Pratt, Tubecntral@aol.com

Are we missing the forest for the trees? This notice is dated May 13, 1996 and is almost three years old. What was the point of the notice and who was being targeted by this reminder? The first line appears to focus on the "10 Meter" Amateur Radio Service equipment, and the implication of the notice is that this equipment does not meet FCC guidelines. Yet there must not be anything about this equipment that violates any of the regulations or it would seem that the importers would have been stopped. In fact, since that time, Wireless Marketing has copied almost the entire Galaxy line with their Northstar radios, and Cobra introduced the 148F GTL DX+. It has always been the responsibility of the radio operator to use the equipment properly, so was this notice directed at them? Have there been any changes in enforcement since this announcement? The Senate bill intended to give local law enforcement the authority to enforce the CB rules had to be attached to the telephone slamming bill as an amendment, and then died in the House. It seems unrealistic to expect radio operators to take the rules more seriously than the people who wrote them.

A "fine" from the FCC is called a Notice of Apparent Liability (NAL). If it is not paid, the next stop is Federal court, where the FCC presents its case and the judge issues an order for the defendant to pay. It then becomes a judgement against the defendant. If he owns real property, it is a lien which must be satisfied, if and when the property is sold. If he goes to buy a new pick-em-up truck, the judgement shows on his credit report and kills the deal unless it is paid in full.

The judge can reduce the NAL in extreme hardship cases. However, most defendants do not qualify for a reduction. Extreme hardship is difficult to prove.

Bad as all this is, there are two elements which can be even worse:

1. Married individuals. How do you answer when your spouse says, "You never had money for the kid's teeth or to get me out of that junker car I have to drive, but you think we have $5,000 to pay in fines for screwing with those stupid radios and breaking the law!"

2. Unmarried, living at home, with an antenna on the roof or in the back yard. Charges could be brought against the property owner(s)--your parent or parents--on the basis that they control what happens at that address. This is most common when the Government wants to collect expenses (like when the boys out west created fake distress calls and the county billed them for Search and Rescue costs), or when a neighbor has sued that you have prevented the "quiet enjoyment of their property" with your radio activities.

The point being: You probably can run that barefoot RCI-2950 for a long time without being caught. Probably, if you handle things with maturity, you even can run some power.

But, attract the wrong kind of attention and someone will come after you. So, think not only of yourself, but of the other folks--folks who don't have anything to do with CB radio--who can be affected by your actions. Thanks, and best wishes.

You know, it really bugs me that a certain few individuals in this ng seem to enjoy nothing better than slamming someone's asking price for equipment. "IF" you can buy it cheaper, then do so! I could care less! In certain area's of the country, when you buy equipment from a shop, you can't always get it for the price you can get it for over the net. So just for instance, let's say that a shop had a "WHIZ-BANG 900" for sale for 250 bucks, and you bought it and decided you liked something else 3 months later. Well, they were selling that same radio over the net for 185 bucks, should you take that loss? In my opinion, not if you don't have to. 225 would be a fair asking price to me provided it was a sound radio, and I wanted that particular item. have a day.

He is, and so is any Radio Operator, Amateur or Citizen Band. The
definition of 'them' are troll's, either commercial entities with an agenda
or disturbed individuals wanting attention. Anyway you look at it just stop
responding, they will go away.

All amateur hf radios manjufactured in recent years have general coverage receive. There would never be a reason to modify the radio unless the owner was licensed with MARS or CAP.

Well, I took my amps out of line and am selling them. Yesterday I turned on my base radio at about 11:30. Nice, sunny day, and I discovered something. My neighbor ACROSS THE STREET could not hear me transmit. I checked my antenna, checked the radio and mike. All were OK. But it is kind of hard to talk with 30db of skip and trash. So, what I have is a Cobra 142 GTL paperweight. That is all that it is good for. Mark, you want us to run legally, and I do too. However, when the results of being legal are what I just described, then what is the point of having the damn radio?

It's pretty clear. Read the FCC Notice at

     Message-ID: <3706d0c1.4246021@beta1.newscene.com>

If a ham modifies the radio such that it can xmit on a frequency which
requires type acceptance before transmission, then the radio cannot be
transmitted anywhere on any frequency.

And a mobile or base runnnig power will have more opportunity to do it
and with more strength.

Dennis accused me of doing with my post what I accuse IBers (Illegal
CBers) of doing. However, there was nothing criminal about my post,
nothing that would subject me to a $10,000 fine or confiscation
action, and my posting didn't even potentially prevent other usenet
posters from exercising their right to post.

You talk about someone "hinting" about something and yet all I see are
people hinting at their unwavering support for criminal activities.

That is not the case . But seeing how you believe it is, why don't
you now go to REC.RADIO.SWAP and get on your podium over
there for awhile?

The entire body of the notice is about radios which 1) are imported, manufactured, marketed or sold with non-type accepted capability (such as 11m), 2) radios which are easily converted to non-type accepted capability by the user, 3) conversion kits for user installation, 4) unlicensed individuals operating on ARS frequencies where type-acceptance isn't an issue, but licensing is.

>... It seems
>unrealistic to expect radio operators to take the rules more seriously
>than the people who wrote them.

To some degree I agree with this. I don't deny that, with lack of enforcement some people will break the rules. You always have a percentage of society who can't live by rules unless they feel they're being watched. Then others feel it's unfair that others get goodies they don't, and they break the rules. Then others feel they can't operate effectively in competition with the others, so they have to ...

Unfortunately, I've never seen this rational have a long term positive effect. Generally more lawlessness occurs, and then someone will take the laws seriously and you'll have even more laws than you had to begin with. Instead of a few efficienados who dabble in "exotic" goodies, you have the vast majority doing it, and then nobody.

However, the corrolary to your observation is "it seems unrealistic to expect [anyone] to take the radio service more seriously than the people who use it." I'm not sure, at this point it even matters.

One thing to keep in mind is, had FCC put forth the Notice in '96 and immediately begun enforcement, there would have been others who complained that you can't ignore enforcement, let lawlessness abound, and then come in and enforce without *any* warning. I personally feel this is the loser's excuse, but the reality is that many people do operate this way (i.e., blame othes for their misdeeds).

However, if the Notice in '96 was meant to be a notice of intent to enforce, look at the effect it had. Do a search at any search engine for "CB Sales" and see what kind of effect this notice had. Nada.

My point is, it wouldn't have mattered what purpose the Notice was intended to serve. IBers (Illegal CBers) would complain about how its not their fault. I think we can agree that if enforcement began in earnest, there's no reason to believe anyone hadn't been put on notice, right?

I am contemplating the purchase of a GE Model 3-5980 handheld CB radio. Does anyone know if these are any good? Any help or advice would be greatly appreciated; please reply to rfdillon@hal-pc.org

How is that not the case. The FCC Notice seemed pretty clear.

Feds: Man Eavesdropped on Police / Agents say he posted
cops' info
on Web site

By Hugo Kugiya. STAFF WRITER

The U.S. Secret Service and Nassau County police
arrested an

unemployed electronics enthusiast from Kings Park after he intentionally intercepted communication sent and received by the mobile data terminals installed in police cruisers, federal agents said.

Keith Knipschild, a former NYNEX employee, was arrested Wednesday in his home at 29 Amapola Lane for intercepting information and posting some of it on his Web site, http://www.knip.com, agents said. Police use mobile data terminals to check for outstanding warrants, review driving records and to send emergency information they might not want to broadcast across police scanners, such as details of an ongoing surveillance or a planned search.

An affidavit from a federal agent found that Knipschild's Web site had 93 pages of police transmissions from March 12, which included criminal histories and warrants, motor-vehicle checks, medical information about victims, and witness statements. Nassau police confirmed the information was transmitted by police on that day. Investigators say a confidential source led them to Knipschild, who could not be reached for comment yesterday.

Federal investigators said three satellite dishes, ranging in size from 18 inches to 12 feet in diameter, as well as a 40-foot radio tower were discovered on Knipschild's property. Calls to federal authorities seeking comment were not returned yesterday. Details about the disposition of the case were not available.

Federal documents indicate Knipschild's Web site includes information of interest to electronic enthusiasts, with links to Web sites about scanners, satellites and dishes, and amateur radio.

Federal investigators said Knipschild used an illegal electronic device to intercept police communications. In a related case, the Secret Service have arrested a San Diego couple, Bill and Cindy Cheek, on a New York warrant charging they sold such illegal devices on the

Internet to intercept police communications. The Secret Service said one of its undercover agents purchased a device from the Cheeks, who shipped it to New York. Details were not readily available yesterday.

Mobile data terminals send and receive information by radio frequencies, which are encoded into a digital or binary format, one that is not available to the public. Furthermore, these terminals are password-protected.

Mini8 and RG8x are the same thing!

And his 1600 will do about twice the power your amp will.

And yes, he needs to upgrade. I ran 8X with my 667 and it worked fine (about 900 PEP watts). Went to the sweet sixteen and killed the coax.

If you have a completely flat match (no reactance on the line), you may be able to get away with it for a while, but if your coax is heating up, it points to a non-flat match at the feedpoint of the antenna (I was running a 102" whip at the time, so my match was not totally flat).

Hope that helps

I run a 4 pill into my 7'ft Nightstick from here in New England. I hit
Europe, So. California, and occasionally So. America on the lower side of
48. Not bad for $17.99. The only downside to the antenna is that you should
try to center load it on the vehicle. I have mine on a ball mount located in
the right rear of a Jeep. There are certain spots where Ill lose my ears (if
the incoming signal is at a right ascension to the right rear corner of my
car). Ask 1200. He's got his center loaded.

But seeing how you believe it is, why don't you now go to REC.RADIO.SWAP and get on your podium over there for a while?

>How is that not the case. The FCC Notice seemed pretty clear.

There are a large group of illegal operators in need of your expert guidance. They would appreciate your legal opinion on REC.RADIO.SWAP
When duty calls you must answer. Don't let them down. It's people like you that volunteer their service that makes this hobby so enjoyable. Give them some enjoyment now.

P.S.

Did you start out your career as a safety boy? Is this when you learned that you had a knack for telling everybody what they can and what they can't do.?

Why don't you ask the people that operate with this illegal
mod. That's not me. That's numerous people on REC.RADIO.SWAP
They would enlighten you better than I. Nothing like going to the
source of the problem is there?

I think i can speak for the majority of people out here and say:
That we would appreciate you going to REC.RADIO.SWAP
and whine/strike that, preach/strike that, inform them of
their illegal activity.

There is a lot more than the rules in the Q/A pool, study
booklet.

> If you are making statements about overall knowledge or general
> knowledge, or even electronic knowledge, I would have to say that I
> cannot agree with you.

Since you don't seem to actually know many HAMS, your mileage
will vary. I know quite a few of both.
Notice I said KNOW, not know of.

> I know, but I am not a proponent of overmodulation, excessive power out
> of a radio, noise toys or roger beeps!

But you are of illegal power amps, As long as they are "clean".
More on this later.

> Since the Amateur Radio charter is that of an emergency radio network,
> and promotes experimentation, I believe you should be required to at
> least be able to do some simple maintainance on your rig to be a ham
> operator.

It's not ALL emergency, or experimentation. Whatever the FCC
says it is, it is.

> I wasn't referring to HAMS, I was referring to the fact that you waled
> away from CB and I stayed to try to make it better...

You seem to have stayed because you couldn't take Amateur
radio, and for other reasons I'll get to soon.

> There seems to be similar problems everywhere, but when the skip goes
> away those big amplifiers will not stick around too long either...

Most around here don't use the amps for skip. Just to talk,
because everyone else has one.

> So we run away instead of sticking around to try to fix it?

Fixing it should no include advocating "clean amps."

> But if you run a clean and legal station and you consistantly sound
> good and are someone they want to listen to, they will pay attention to
> you, and you will be setting a good example for them to emulate.
> But you can't do it by talking OUT OF BAND!

If you run a clean, legal station, you will not be able to
talk. You will be a "mud duck." You will be told to buy an amp.
And you'll say it's OK as long as it's clean.

> I do that here, but you don't like it when I tell someone how to make
> their amplifier run cleaner... and it doesn't make any sense to me that
> you feel that way, because a clean amplifier causes less harmonic
> distortion and other interferrence.

So I guess a clean amp is OK?

> If you think I have been 'going with the flow', you better take a look
> at all my posts over the last year or so!

I have. You are.

> It's not profitable now!
> It pays for my test equipment toys, and that's about it...

Some things seem more important than money. If it pays for something, then it's profitable.

But it doesn't. Again about your should.
At least you're beginning to see the difference in what you
think should be, and what is.

DUH??? I've seen numerous posts, by you, that state that you have helped some of the amp builders design, redesign, troubleshoot, and modify their product. Not just advice here, but where the device was on your bench. In doing so, you are helping to produce a product that will, and you know it, be used illegally.

> but if
> I can help someone make it run more 'cleanly' by offering technical
> assistance, why is that wrong?

Because it's the law?

> Equipment that I work on can be used legally or illegally, just as your
> guns can.

> > But you do work on stuff that you know will be used illegally?

> No more than any gunsmith would.

So as long as a gunsmith does it, it's OK for you to do so? More, and more, you make my points.

> > It was at one time illegal for you to do so, KNOWING that it
> > was to be used illegally.

> Not true.

> I don't have to ask how the device is going to be used.

Splitting hairs. You don't HAVE to know, but if you DO know, it's illegal.

> What exactly did he show you?

Something in one of his books that stated that he couldn't knowingly work on something that was to be used illegally.

> If you have a non-type-accepted HAM transceiver and it has it's 11
> meter transmit enabled you are illegal.

Not so. I can't legally use it on CB, but I can own it. Show me the rule that says that I, as a HAM cannot own it.

> Do you have a license that allows that much power on AM?

What has the mode got to do with it? It says 1500 watts PEP.

> And I believe that if you read part 97 concerning HF amplifiers you will find that there are other requirements that must be met for that HF linear amplifier to be legal for HAM RADIO use (unless you built it yourself).

And if you read, and comprehend part 97, you'll see that they tell manufacturers what they can make. The end user is told where he can operate, and with what restrictions as to power levels. The Amateur operator is mostly left on his own, as to WHAT he can own. As long as he confines his operations to his legal bands, he can mostly own what he wishes.
Don't forget, your should don't count.

> For 10 meters yes, but it should still have the traps in it to restrict operation on 11 meters, or you have to submit it for wither type acceptance, grant of waiver, or have scratch built it yourself.

Again your should applies here. Once it's in my hands, it's up to me to operate it as I should. I can modify the thing, as long as I don't operate it where I'm not supposed to.

> And only one a year!

Of one TYPE. Again, once it's done, I can sell it to another HAM legally. Purchase from another HAM legally. Sell it back to a dealer legally, and purchase from a dealer one that has been modified. As long as it's done among Amateurs, it's legal.

> If you purchased that amplifier after April 28th, 1978, and cam with 10 meter capability in it, the shop you bought it from sold it to you illegally.

You need to read it again. With a license, I can purchase it legally. From anywhere.
Again, you're wishing.

> That transceiver could not be legally sold as a ham transceiver with 11 meter transmit enabled; even as a 10 meter ham transmitter.

They don't come with 11m enabled. Some CB tech modified them.

> To get 11 meter transmit capability the HAM would have to modify the legal radio after he purchased it.

I still can't find any reference to this. As long as the licensed Amateur doesn't use it on CB, he can use, and modify it all he wishes.
You don't understand the Amateur rules, pertaining to equipment

allowed.
We are told where we can operate.
We are told in what modes.
At what power levels.
How much bandwidth each mode is to occupy.
Antenna height restrictions.
As long as we stay within the above guidelines, we can operate
most anything we desire. ANYTHING.
I'm sure you don't like this, but it's true.

> As so as he enabled 11 meter transmit in that non type accepted radio I
> would become an illegal radio because NO ONE COULD LEGALLY TRANSMIT ON
> IT ON 11 METERS! And it could no longer legally be sold (marketed), even
> to another HAM!

WRONG!!!!!!!!!!!

> Then someone had better change those rules because the way I read the
> rules it would be illegal for any transceiver to be marketed (sold) with
> transmit enabled on the 11 meter band.

BY A MANUFACTURER! A DEALER CAN SELL TO AN AMATEUR, USED
EQUIPMENT THAT IS MODIFIED. AS CAN ANOTHER HAM.
This is what is said.

> Since A HAM cannot legally transmit on the 11 meter band with that
> radio, the only possible reason he could have for modifying the radio to
> enable the 11 meter transmit, would be to illegally transmit on 11
> meters!

But as long as he doesn't transmit out of his assigned bands,
and adheres to his other restrictions, he can operate anything
he wishes. The rules tell an Amateur WHERE, not so much WHAT he
can operate with.

> It would also require a request for type acceptance or a grant of waver
> from the FCC to have such a modified amplifier legally in your
> possession.

Again, you're wrong.

> But I will continue to rebuke any posts I see made by HAM operators
> putting down CB operators on a CB newsgroup!

I will refer to legal operators as CBers. Illegal operators are
just that. Illegal operators.

> Your (our) posts here have been part of the problem.

My part of our posts is about to stop. I will continue to give
advice on legal CB operation, and if something happens to come
up pertaining to Amateur radio, and I feel like it, I will
respond. I'll try to confine that to email, unless I deem it of

general interest.

> If you don't want the post stirred; don't hand me the spoon!

I don't mind the pot being stirred, as long as it's done
courteously, and factually.

No. They were people selling CB equipment.If they had been
HAMs, I would have said so.

> So he, a HAM operator, illegally sold you a HAM transciever capable of

> transmitting on the CB band, without ever verifying that you had a valid
> HAM license!

Nope. Why the comprehension trouble?
It was a national dealer, and the rig was new, and would not
operate on 11m. He stated that I needed an Amateur license to
purchase the radio, or state that it was not to be used out of
the Amateur bands. Store policy. I stated it would be a present
to a HAM, and we proceeded with the transaction.

as a rule the more you have in the air the better the ears are. alot of antenna xmit good. in rcve the antenna area is called capture area and the more capture area you have the more signal you will capture.   for automobiles dual antennas are usually a waist of money.   a single antenna placed in the right spot will do just as good at half the cost.   however for a 18 wheeler pulling a refer or dry box dual antennas are the best .

Sorry, KS22101, but you didn't read up on this subject very well. You should read
Sec. 95.413 to determine where you have misinformed this individual. You don't
need
a HAM license to talk to someone 15-20 miles away, totally legal to do with a CB
radio.

KS22101 wrote:

Yep I got one...Did you have one and now you miss it. Well here's your
chance. This is a Browning Baron SSB/AM CB 40 Channel in the best shape
I've seen in years...Gold Face... It has a Turner+3 hand mic, mobile mount
. and get this... I got the box...
     This a specal radio so my asking price is 200 dollars ...that price will
cover your shipping within the Good'ol USA
-- Ham radio trade offers welcome too.....

>recommends you modify the radio by >cutting D14 audio limiter and

Cutting D14 will give the radio very loud modulation. Once you cut D14 you will probably not be able to run a pwr mic on it.
If you have never done a tune up I would take it to a "tech" who can do it for you. You can expect to see 15-18 watts peak on a tuned 510. It is one hell of a loud little radio once the peak mod has been done.

I have an old favorite saying, used in jest, but useful here----"People who think they know it all are particularly irritating to those of us who do."

1. CB works extremely well at a range up to 20 miles with an adequte antenna.
2. What is 'something called a HAM radio'?
3. Check the dictionary for the meaning of 'permit' and compare to 'license'.
4. Never correct someone when you don't know what you are talking about. You might be accused of being a politician.

Sorry to disappoint you.

Sarcasm......grow up, (you have a delete key also) because you are completely missing the point. Where in the Part 97 Rules and Regulations does it state that a licensed amateur must inform a CBer (or anyone other than a Ham) of the FCC Rules and Policies. No one has deemed Amateurs with an enforcement badge (although most of them think they have one). Jeff Herman doesnt even use a CB radio, nor did he ever contibute to the postings on this group other than to spew forth FCC rules and regs. You guys make me laugh, you are so busy making sure everyone else is following the rules, while at the same time your own hobby is going straight down the toilet.

Just because I own a rifle doesnt mean I should go to the Gun oriented newsgroups and tell those folks how to use one. Mr. Herman is doing just that!

Hi, in a previous post, someone mentioned that the Alan 9001 10 meter radio, after being converted to CB, was the 'best' buy out there.

What does this conversion entail, ie. how does one go about doing this? From what I read on the Copper page, this radio puts out 100 watts. Is that correct?

Thanks, Dave

no. its a 25 watt radio. you would be better posting the request for the channel mod on the uk rec.radio.cb board because the radio is more wide spread over there. 73 tim 2-IR-082 www.irdx.org

Yes, I also have a delete key and believe me when I tell you that I use it alot. Some of the crap here is just too darned funny not to read though. When you drag the amateur issue out, it is nothing more than a red herring. Nobody would say that just because you own a gun, or fish, or cross dress, that you shouldn't be permitted on this newsgroup. Whether CB is operated legally or not is not an amateur issue. Some guys try to make a comparison but there is no comparison. They are two separate services with unique rules. There is no overlap other than rf. I am here because I use CB and I do it legally, and I am old enough to remember when EVERYONE on CB operated legally and behaved like gentlemen. I get very irritated with guys who who choose to break the rules, and I get a huge smile on my face when I read that some jerk has lost a couple hundred bucks when he sends his money to some guy name 'creaper' and rather than getting an amp in the mail, receives a nicely wrapped brick, and then wants the postal inspector to fix it for him. Selective enforcement.

I really don't give a rat's ass about Mr. Herman, but if he wants to post the Part 95 rules, and if someone reads them and as a result becomes a better operator, who has it HURT? The hobby needs a few GOOD operators; it is apparent from listening to 11 meters that there are more bad than good ops. How many guys open the box and read the rules before plugging the radio in? I'm sure I can count them all and not use both hands. By being stressed by having the rules posted, can we all presume that you subscribe to BAD operating practices?

I assume (since you again fired the first shot) that YOU are to be allowed to say anything you wish about ham operators, and THEY are not allowed to respond.

I'm impressed that you have been here since 1966. So how could you get so uptight over someone posting the rules for CB?

I have to go along with the other responses. Either you are sore that you don't have a ham license yourself (and in the past you have claimed that's not the case), or you don't want to acknowledge that there ARE rules for the CB radio service.

I've been active on CB since 1962, and I've seen a lot of changes. I don't agree with everything that goes on. But that doesn't keep me from enjoying my radios. I sure don't get bent out of shape when someone posts something in the NG. And I sure as &$^# ain't leaving CB radio just because YOU don't like anyone who holds a ham license.

Operate any kind of gear, in any way that you wish. But don't deny newbie's access to good, accurate information. I suspect you'll still sell as many radios as before, so relax.

>When
>you drag the amateur issue out, it is nothing more than a red herring.

You're absolutely right Gary and the reason why that Herring gets pulled out by myself and others is because there are Hams on this newsgroup that pretend they are interested in CB as a hobby, however if you go back and re-read all of their postings you'll never see any of them contributing to any commentary other than that of illegal amplifiers and poor CB practice which is designed to do nothing but stir H&D. Oh, they'll justify their remarks quite eloquently by reminding everyone of the illegalities they are trying to single handedly correct however they never seem to have any real suggestions. Take a look for yourself and scroll through some of the older postings on this NG.

Ive noticed that Hillbilly Dave, QRM, Yourself and several other vocal Hams have posted to individuals seeking advice on issues which because of your cllective experience with the hobby, you have been in a postion to answer these types of questions. However, there are those who's only motivation is to intentionally ram the rules and regulations down the throats of many in order to correct a small minority. Once done, they assume this pissing match for days on end. I too have fallen victim to these exchanges which I guess is giving someone, somewhere extreme enjoyment.

We all know who these people are. They are either carrying this torch for their own entertainment, or they are sorely confused on what role an Amateur Licensee must assume. This Herring, as you called it, is food for these individuals. Ive been frequenting the alt.amateur.radio. newsgroups for some years now and I cant ever recall a CBer posting to these groups what a Ham should or should not be doing whether legal or not, because if it did happen, the Amateur community would be all over them.

Am I abrasive, obnoxious and rude? The answer is yes. People take me for what Im worth to them, which may be zero, however Im not a hypocrite like those who are here only to stir some shit for their own jollies.

Well, as a matter of fact, yes--or I used to be. Looked at your web page and although tastefully done, also needs some grammatical work and spell checking. You are what you write.

What is the likelihood that some of these nasty amateurs aren't amateurs at all but CBers who just enjoy getting a rise out of you? We all know that at least one or two guys here say they are or used to be hams but have 'unlisted callsigns', and how easy is it to get a lame hotmail.com address? CB, as has been discussed before, just isn't a topic of discussion on the amateur side at

all, either on vhf or hf. The only time it comes up on packet cluster is when
an intruder shows up on the 10 meter band, and whose fault is that?

> You see... everything becomes subjective to to a man who believes himself to be God. This man-God can decide that something is right for him but not right for others. A man-God can change the rules at will and from moment to moment. A man-God will eventually believe he has absolute, unconditional, and subjective power. A God, you see, can do no wrong.
>
> The religious believe that in the beginning there was God, that God made everything there is including man, that since there was nothing in the beginning but God, everything that exists had to have been made from the only material available, God, and therefore everything that exists must be a part of God; but no part can ever be equal to, as great as, or greater than the whole.
> No human is God. No human was, can be, or ever will be, God.
>
> I find it strange that those who do not believe in God, those who ridicule the religious... targetting Christians in particular, use the same argument to prove that man is God. They deny God... then argue that in the beginning everything sprang from God ergo man himself is God... a terminally flawed argument if ever there was one.
>
> Socialism, and ultimately communism, cannot succeed unless God is destroyed.

>What is the likelihood that some of these nasty amateurs aren't amateurs at
all
>but CBers who just enjoy getting a rise out of you?

Come-on Gary you know as well as I do who these characters are without going
to qrz.com. Believe it or not hey really dont get my blood pressure up
although it appears by my demeanor that they do. This is my "having a great
time" attitude.

>We all know that at least
>one or two guys here say they are or used to be hams but have 'unlisted
>callsigns', and how easy is it to get a lame hotmail.com address?

I agree, but these arent the guys for whom Im speaking about.

>CB, as has
>been discussed before, just isn't a topic of discussion on the amateur side
at
>all, either on vhf or hf. The only time it comes up on packet cluster is
when
>an intruder shows up on the 10 meter band, and whose fault is that?

The only time I hear CB mentioned on the Ham newsgroups is when someone is
referred to as a "Chicken Bander" as an insult or when someone makes a

comment that HAM radio has gone down hill since they let in all of those CBers when the FCC passed the No-Code Tech license (ala Kevin Munster or whatever his name is).

This newsgroup never had a problem with Hams (as a matter of fact, their opinions were welcomed) until Mark Fuller started cross posting "linear oriented" CB threads to the amateur newsgroups in an attempt to throw some bait out for other Hams to latch onto and to cause animosity between the two groups (which he was successful). The results of which brought a few self righteous individuals to this group who dont have much to do to entertain themselves.

Mr. Fuller still posts to this group under an assumed name (aol accounts aren't very difficult to hack).

"Just when I thought I was out...THEY PULL ME BACK IN!"
- Al Pacino, in The Godfather

Regarding "who should be allowed to post in this newsgroup": are we suggesting that only those who answer technical questions from newbies should be permitted to express their opinions in rec.radio.cb?

I'm afraid that would bar half the people who frequent this NG from posting. Not a very democratic idea.

If someone gets your goat, it's because you let them get it. A person can simply choose not to get drawn into pissing contests. I suspect a lot of flame wars are carried on by those who see the usenet as being "for entertainment purposes only". Again, we have free will over our actions. We needn't take every opinion posted on the newsgroup as a personal attack. Although it seems some do.

hence antron 99's nick name "splatter stick".....there is several things you can do...#1 run a legal station....and keep your modulation no more than 100%....install a low pass filter at the back of the radio...
if you have done this and still come in on the phones then move your antenna to the other side of the house. if the antenna is at the same level that the neighbors are then raise it above them. a good 5/8 wave antenna will out do the 99 and bleeds alot less. so you may want to shop around and if all that fails there are some good high pass phone filters that should do the trick......after that let them call bill clinton if they want to.
you've done your part. ...   .   just make sure your station is clean....

Greetings!

No, this is a voltage problem.

How the backup battery?

Does the radio reset itself often?

There are two voltage regulators on the CPU board, one for 8V the other for 5V. It sounds like one of these regulators that powers the main buss of the LCD display, might be under "foldback".

Foldback is when the regulator can't deliver it's rated voltage to the numbers of amps [current] it's trying to source from it to the parts that are requesting power from it. It simply drops voltage.

It could also be from a switch, but the RCI is push-button. I'd check voltage regulation on the main board PCB as well. The noise blanker and these other circuits are powered by the main 8 volt regulator on the main PCB. If the voltage is low, the "toggle" to show logic 1 to the main PCB to turn on that portion of a circuit is actually sinking current from the front PCB and should be checked and gone over to ensure there are no loose connections. This would make the "BEEP" NB and other symbols that are logic indications that these circuits are on, to show weak in the display because they are lacking voltage to make them "twist" in the LCD display to show that they are on.

These logic toggles, are buffered to the outside, or to the main PCB. If the main PCB or on-CPU regulators are overtaxed, the dimming occurs.

Check for cracks in the PCB's both the CPU's and the Main RF boards right around connectors.

Some some points of ponderment...

Hope this helps.

On Mon, 02 Aug 1999 01:02:25 -0400, While the Monitor displayed an idea about "...and now 2950 problems   78o" from 'aardvark <stumpy@noisp.com>'. The Keyboard responded with this:

:+>   I've had a 2950 for the better part of 3 years now and now I got a
:+> problem, when I activate the roger beep and/or the nb anl and/or lock
:+> functions they don't show on the display except when I view the radio
:+> from an extreme top or bottom angle. I suspect there might be a problem
:+> with the polarizing filter but am not sure as the rest of the display
:+> works fine and also that there are no cracks.
:+> Again as always any help would be appreciated thanks,
:+>   john
:+>

Regards!

Does anyone know where I can get help repairing a radio? I got a President Madison that I cant get to transmit. I changed the final, driver, and predriver and still nothing. I would like to get it fixed but there is no radio doctors near me. Any help and responses are greatly appreciated.

Chippy

Greetings!

On Tue, 03 Aug 1999 02:41:40 GMT, While the Monitor displayed an idea about "Question on Antenna and Speaker" from '"Jon Grahmann" <jonboy74@bigfoot.com>'. The Keyboard responded with this:

:+> Bought a Uniden CB based on the posts here, but have a question
:+> about the antenna I bought and about a PA speaker.

Ok, Hope you aren't dissapointed in the Uniden. If this is your first time at it, take a moment or two to search the web to find out things about Uniden - you be happily surprized...

:+>
:+> Antenna - Bought a Radio Shack fiber glass antenna -48" whip
:+> Should have excellent grounding

A permament mount is the only way to get "excellent grounding". However, a good mag-mount and the radio mounted to metal that grounded to the vehcile - will also get you some good results.

Placement of the antenna/mag-mount is the problem. On the roof for best results and ease of tuning, but any other location you'll have to settle for what you get in performance.

:+> PA - Are all PA speakers for CB's created equal? What is
:+> a fair price for a decent PA and what should I look for
:+> when I go buy one?

Most PA speakers are rated in Watts, I'd go with one thats at least 10 watts in capacity [rated watts]. Some PA/Bullhorns can go as high as $35 dollars. Check and shop around, 10 watts is about the least you want to go for long life and understandable speech out of it.

Regards!

:
:You're referring of course to the package-bomb murder of Chris Marquis in
March
:of 1998. You might want to temper your remarks. People who post
threatening
:messages can easily become subject to investigation.
:
:---
:
:Just eight days before 17-year-old Christopher Marquis opened the UPS
:package containing a homemade pipe bomb that killed him, wounded his
:mother, and blew a hole in the roof of their house, a message appeared
:on Usenet. Posted from an America Online return address to rec.radio.cb

:- a newsgroup for CB radio enthusiasts - the angry message warned
:readers about a "lying faggot backstabber" named Chris in Vermont,
:running a mail-order radio scam over the Net.
:
:"If someone will help me get a plane ticket to Vermont," the message
:bristled, "I will go pay him a visit and show him what a 6 ft 5 in.
:redneck does to people who steal his hard-earned money."
:
:Three days before the murder, another message posted from the same
:address specified Marquis' hometown and the street he lived on, bragging
:that the poster would give the young man "some severe dental problems to
deal
:with," and threatening the teenager directly:
:
:"Are You listening Chris? When You see a 6 foot 5 inch, dark haired man
:at Your door, You better duck 'cause I will be about to drop the maul on
:Your noggin dude."
:
:One day after the murder, the author of those incendiary posts was already
:pleading not guilty to the crime following a torrent of mail:
:
:"To all You pesty reporters who keep emailing me with questions... I do
:not know anything about that incident... My good intentions to warn
:others has now turned and made me look bad."
:
:When the FBI announced that a suspect was in custody last Friday,
:several posters to rec.radio.cb felt confident that they already knew
:his email address. Quotes from the threatening posts even found their
:ways into news stories about the murder.
:
:They were wrong. The messages had been posted by another of Marquis'
:disgruntled customers, not by Chris Dean, the Indiana trucker who
:authorities believe concocted the pipe bomb from instructions he found
:on the Net.

Greetings!

Out of the box, 3 ~ 4 amps. Maybe 25-40 watts SSB, and it's not too tolerant of high drive - so keep modulation and/or power low when driving it on SSB. AM too.

A little "tweaking" you'll get 5 amps and maybe 40 watts AM, and yes it does get warm and it does sound cruddy when overdriven.

To me though, it's not worth the trouble.

Maybe as a small low-power modulator, yes it works for that, but any two pill will get you there a lot better than the "Dragon" or Mosquito.

I just don't want to see you go after low power and find out that the radio sounded better without it than it did when it was on.

Good luck.

If all else, it makes a neat paperweight and conversation piece. ;-)

On Mon, 2 Aug 1999 22:53:20 -0400 (EDT), While the Monitor displayed an idea about "Dragon 30" from 'thumper485@webtv.net (Chris)'. The Keyboard responded with this:

Greetings!

If you want good general performance, anything in the 5 foot or longer antenna length range, will put you in the running.

Mag-mount's work, but a permament mount [the ones that require drilling holes - gulp] is the best. Even if you only put a 2' antenna on a permament mount - it will do better than a mag-mount of the same antenna.

Oh, be sure to set you WIN_98.INI file to read...

CAPS-LOCK=off.

Thank you.

Greetings!

No, it doesn't help the antenna any. It won't help reduce noise, or strengthen signals.

The only thing it will do, is allow the radio to "see" a low SWR. But anything past the Antenna-Matcher, is still the poor antenna's own SWR.

On Fri, 09 Jul 1999 04:00:23 -0400, While the Monitor displayed an idea about "ANTENNA TUNNER" from 'Saturn1000 <Saturn1000@earthlink.net>'. The Keyboard responded with this:

Gary: This is a great example of the ineffectiveness of grounding to
prevent RFI and/or TVI. As always, interference is tough to troubleshoot
correctly when you're not on the site. My diagnosis is feedline radiation.
Most likely, the coax has less-than-the-best shielding, combined with no
decoupling at the antenna, and finally the whole station is pretty close
physically to the stuff picking up the interference. No amount of grounding
whatever will fix this set of problems. Here's a few suggestions that just
might work.
1. Move the antenna higher, and far away from the neighbor's property.
2. Change to a ground plane-type antenna. No, adding radials to an Antron
won't usually work! Maco V-5/8 is good.
3. Use a GOOD grade of coax, with a very high percentage of shielding. I use
Belden 9913, because it's double shielded. Other coax will work, but no
cheap stuff!!
4. A choke made by coiling 6 turns of the coax about 6 inches in diameter,
taped nicely together,right at the base of the antenna, will keep lots of RF
off the outside of the coax.
This is only a starter. If the modulation is excessive, or the radio
has been dinked with, this only adds to the complexity of the problem.
I also recommend downloading the FCC's interference booklet from their

website at
fcc.gov. Eliminating interference is tough but do-able. Hope this helps.

Damn, thats a dirty setup- I bet you also use a transistorized base amp.
Dump the galaxy- get a clean radio that has the mod limiter still
installed, dump the A99 and get a Maco 5/8.

It will be all good.

Get a Wilson 1000. They are great antennas ! As for the typing in ALL CAPS... I kinda' like it. It's much easier to read.

```

Nice.. Haven't seen one is about two years. Really nice amp, really nice.. Im my own opinion, if you like Texas Star, you will like this one too. Nice clean signal.... This amp is no joke, and the price is very nice. I let one go already, if only I had another easy $220.00 I'd buy it myself. Oh well, so is life...

Hank

(I would be buying it strictly for the 28MHz band of course. That an to key up beside R Hooligans house [Oh well, had to say it])

You know. Hmpt. I want so much to go off on you. You contribute NOTHING more than sarcasm to this newsgroup. Why? If you disagree to something, then fine. But honestly, no one was asking your opinion on linears themselves, nor were they asking for anyone elses. So now we are all reminded that you do not like linears. Horray for you my friend.

Look.. You want to post sarcasm, fine go to it. No one can help that the best of you were the last few drips down your daddy's leg. Seriously. It is no ones fault but his own.

Actually, now that I make a more carefull analysis of your post... it seems (and correct me if I am wrong) as if you are suggesting homosexual acts...? Thats fine.. It is your paragotive. Take care pal!

"Hank" (oh, RHOOLIGAN [bless his soul] already discovered my
name and email address were fake, sorry, no fun for you)

Scott,

What post? Your original post? Dont worry about it. You didn't say only 8 watts. It must be the one that I know of... Besides my friend, by spending $21.99 you can purchase a oil-can dummy load which will handle 1000 watts vice the 100 of the Radio Shack model. Just to let you know... Take care.

Hank

...One of the problems with using the manual side is that it was
never meant or designed to work as a vfo on TX.
...The voltage regulation is poor on the hi voltage supply to the
vfo.
...Tram designed this radio to rcv only on the vfo and didn't put
any effort into the stability of the vfo for TX purposes.
...What you can do.Since there were a couple of ways to mod the
radio you'll need to discover a couple things before hand.
...First, with a freq counter or well calibrated rcvr, check to see
if the xtal osc.'s are correct on freq and that they don't change
freq between TX and rx. This is done with the manual side on. If
these are good then the next thing to check is that the vfo is not
changing freq too much between TX and rcv.
...More than likely the vfo is the culprit. You can minimize the

shift in freq by running a ground strap along the pcb. The straps are to correct the poor grounding between the vfo cap and coil (mounted on the chassis) and the actual vfo osc tube on the pcb. I just made short jumpers from point to point along the pcb in a way that produced the straightest path to the tube ground from where the coil is grounded.
...Next I installed a zener diode regulator in the plate supply to the vfo tube. This helped considerably and if I remember correctly you could also do this in the cathode of the vfo tube circuit if you didn't want to mess with hi voltage.
...These mods should produce a vfo that has less than about 30-40 cycles shift between TX and rcv.
...A note on those xtals. The main osc xtal bank is switched off in the manual mode except for a couple of the xtals. These xtals are used for the offset between the am and ssb modes. These xtals have an adjustment pot on the main xtal board that can be used to improve the shift between TX and rcv if it is wired correctly.
...Like I said before, there's a couple ways to mod the radio and some are more involved but produce a more useable radio.
...Good luck in finding someone who knows these units well enough to make the improvements.

I agree. However, no matter what you do, you couldn't set it for a 500 watt dead-key and have it not backswing on an average-reading Bird 43.

If I'm not mistaken, that's what someone who responded to the original poster said. That's simply not the case. To make the deadkey wattage hold on a Bird 43 when modulation is applied the peak wattage has to be 3 times the original deadkey wattage. For example, if an amp deadkeys at 500 the peak power will have to be at least 1500 otherwise you'll see backswing on a Bird 43. Making a Texas Star 500 peak at 1500 watts will require the use of just about every competition trick there is--there's absolutely no way that it'll do it in stock form.

-=PEAKABOO=- wrote:
>
> Hey Bill what radio were you driving these DX-500Rs with?

     A tuned up President Jackson (MRF477 final).
```

The power supply is a Vietnam era Army surplus unit (designed in 1962 and built in 1975) that runs on 220 and feeds 1/0 cable that ends in a homebrew terminal block (a piece of wood with carriage bolts through it) on my test bench. It's potential output is in the 120 amps at 19 volts (2280 watts) range.

The dummy load is a finned, oil-filled, 600 watt continuous type that came from Raytheon but was made by some other company.

The meter is a Welz-built Palomar PW-5000 whose peak measurements run hand-in-hand with my military Bird 43 that has the latest generation peak-reading kit in it.

The bottom line is that I'm pretty damned confident that my readings are accurate within +/-5% under the test conditions that I laid out. If you've followed this newsgroup for any length of time you'll know that the wattage readings I post are generally considered to be very conservative--and that's putting it lightly. A few people have all but accused me of posting artificially low readings. So, if you duplicate my test conditions, chances are you'll see my numbers or even higher numbers.

The Texas Star 500R is a kick-ass amp, but it has it's limitations. ANYONE--I don't care who they are, would be hard pressed to make a 500R produce 500 average watts at full modulation on a Bird 43. It would take full comp set-up to make that happen. Full comp set-ups run 10 seconds out of every 20 minutes--they aren't practical, daily-use set-ups.

In a mobile--yes. In many cases the 636L is even better
and it costs less.

In a mobile--especially a noisy mobile--you want maximum
noise cancelling. The 636L Astatic and the RK56 Turner
are by far the best choices in that situation.

You don't--the guy doesn't know what he's talking about.

You can play with turns ratios and capacitance values
all day, but you won't see more power until you increase
the drive and supply voltage.

I agree. Dragon, Mosquito--whatever they're called
they're of minimal value.

Think about it--the output power transistor in that
amp is the same one that's used in most sideband CB
radios--the 2SC1969. You can't squeeze blood out of

```
     a rock.  To get increased power you have to use more
     and heavier power transistors.  A pair of MRF455s is
     what I consider the minimum required to make an amp
     worthwhile.

If you are running legal power, don't worry about the phone calls to
Uncle Charlie. A big part of the problem is the Part 15 devices being
interferred with. First, I'm not sure why or how you grounded the
antenna, but did you ground the radio--Not to the electrical plug, but
to a ground rod, seperate from the house elecrical ground, and
short-avoiding a 1/4, 1/2 wavelength of 11 meters? If the radio is
located near an outside wall, go through the wall and use a copper clad
rod right there. If this hasn't got it, and yes, your radio is legal,
then the ball goes to the neighbor. Offer them some ferrite material to
wrap phone and stereo wiring. Under no circumstances should you enter
their home and do any work for them. Can you spell law suit? No doubt
they have a 6 meter phone and not one of the newer 900 MHz jobs. Those
just never have a problem. You can offer them some .01 mF caps to put
across the phone microphone wiring and at the speaker of the stereo
system, but you have to be very careful with the speakers to prevent
them from going into oscillation.

Lets put it this way:

Every night Mr. Stein prays to G-d to win the lottery. He does this
every night for 40 years. Finally, one night, he prays to G-d to win
the lottery and lightning strikes the house, and a glowing light
hovers over to him and a voice booms; "Buy a f*cking ticket!"

(Just a joke I heard. Thought this was a good place to pass it on.)

No.  An antenna tuner is only good if you want to use an antenna that
was made for one band, on another band.

I'd say there is a good comparison. All forms of two way radio is

amateur radio. Just because someone doesn't know how to build an amp
or an antenna doesn't mean they aren't every bit of an amateur radio
enthusiast as a licenced ham.

>They are two separate services with unique rules. There is no
>overlap other than rf. I am here because I use CB and I do it legally, and I am

There is an overlap. The CB rules are basically a derived set of the
amateur rules and hence are a more specialized set of rules.

Close but no cigar. An antenna tuner is used to adjust high vswr so that
the transmitter sees the antenna as a 50 ohm 1:1 match. A better antenna
might improve your reception.

Thats sort of a problem. One thing a proper operating CB needs is a
good antenna, which means a fairly big antenna. I personally think a
Wilson 1000 makes a car look better, but thats just me. Anyway, about
the minimum you would want to go with is maybe a Wilson little Wil'.
Its a base loaded whip antenna, but its not as big as the 1000. And
it will not work as well.

You can get a cellular look-a-like, but it won't work any better than
maybe 2 miles.

Look for a SSB mode and class AB biasing for SSB and possibly a bias mode change for AM. An RF pre-amp is good for receive. Try the Texas Star 667V. It is AB biased for clean SSB plus a pre-amp and I happen to have one for sale as well.

I'd suggest either a PC66 or 68 from Uniden. They are available with weather
bands, and can be modified for +/- 40 xtra ch's.

>I'm putting this in a sports car, and I don't necessarily want another
>antenna. A glass mount wouldn't be too bad, but what about adapting the
>AM/FM to CB use?

As the others have stated, the antenna is a critical part of your
communication. A top loaded whip mounted to a bracket that bolts to the frame
from under the back bumper would save your paint, alot of vette owners use
this.

You're kidding, right? Let's see, there is amateur, cb, frs, marine, mars, cap, and perhaps something I have overlooked. Some require knowledge, background and testing, others require that you write a check at Walmart. All amateur? Get real. You might be a radio enthusiast, but you are NOT an amateur enthusiast.

More specialized meaning more restrictive, i.e., you have the ability to buy stock equipment, do nothing other than plug it in and talk. You can't operate any mode except phone. You are not required to know any more than the difference between a positive and negative wire if that. Look at the nature of the questions and answers here. There is nothing wrong, second class or otherwise about CB. It can be compared to nothing other than CB and perhaps FRS. If you want to be an amateur, go get a license. Nothing stopping you except your willingness to get after it. You are catering to those here who claim that all CBers are amateur wannabees.

As reported in rec.radio.cb before, http://www.rebateco.com is selling GE 40 channel handhelds, free after rebate except for $3.99 shipping. Given the price, my father-in-law and I have each ordered one, and I expect to use them in late-summer hiking.

Reading past messages here, it seems that these GE handhelds have OK electronics, but their range is usually poor due to a too-short original antenna. To bring range up to a couple miles, the two most popular recommendations seem to be:

A. Buy Maxon WTA-1 42" telescoping antennas specially made for handhelds. These seem to cost at least $32 a pair including shipping.

B. Get center load telescopic car/truck mount CB antennas, probably using a BNC to UHF adapter to hook into the handheld. This option, according to one poster, is "slightly more cumbersome" than the Maxon but gives "much better range."

Now, my question. Can anyone recommend a not-overly-cumbersome antenna model of type "B" above that will both work well and come close to the Maxon WTA-1 price?

Thanks for all ideas.

Steve Eisenberg   Wynnewood, Pennsylvania U.S.A.

I want to set up a communication line between a rural village and a
church in San Pedro Sula, Honduras. The distance between them is about
10 miles, through hilly terrain, elevation change is about 600 feet.
What is the best way to communicate when there are no phones or cells?
CB? Ham radio? Something else?

Your help in this matter is much appreciated.

Thank you,
Young J. Son
Boston, MA

Yep, stay away from the 1969 and MS1306 baby amps, they burn out very easily, but Bill, a single pill, 455, 1446 or bigger, would be doubling your power four or five times over a 4 watt radio, I'd call this is a worthwhile increase in a small, low current package.
Of course it's not as cost effective as a two pill amp since it has all the same parts, less one transistor.

CB might work, if you put up good antennas and can tolerate some interference.
This is already a standard means of communication in parts of the world where
telephone service is non-existent or unreliable.
```

Be aware that, by international agreement, there are frequencies scattered throughout the radio spectrum to accommodate a wide variety of situations similar to yours. You would have a choice of several ITU channels with different characteristics to allow you to avoid interference or to take advantage of day/night propogation.

You will not find these transcievers in regular CB or Ham stores. However, they are available "off the shelf" if you go to the right places. If you need a referral to a resource, E-Mail me at QRM2000@aol.com and I'll put you in touch with some folks who have helped in other church and medical missionary situations. One caution: These ITU Channel radios cost hundreds of dollars apiece. CB is much less expensive.

Best regards,
QRM

>> or an antenna doesn't mean they aren't every bit of an amateur radio
>> enthusiast as a licenced ham.

Gary Danaher responded:
\>You're kidding, right? Let's see, there is amateur, cb, frs, marine,
\>mars, cap, and perhaps something I have overlooked. Some require
\>knowledge, background and testing, others require that you write a check
\>at Walmart. All amateur? Get real. You might be a radio enthusiast, but
\>you are NOT an amateur enthusiast.
>
>
QRM sez:
EASY, Boys! Let's not start at 250-message thread. Both of you are saying the same thing, but in different ways.

CB could be construed as "amateur" in that it is not "professional". Meanwhile, the Amateur Radio Service is so-called because in the beginning, that is where experimenters could "fiddle" with their equipment. In the very early days, no license was required, by the way. Only when regulation was brought in to bring sense out of chaos did the license and call letter system begin to evolve.

Jenkins quoted someone thus:
>> >They are two separate services with unique rules. There is no
>> >overlap other than rf. I am here because I use CB and I do it legally, and
>I am........

And Jenkins responded:
>>
>> There is an overlap. The CB rules are basically a derived set of the
>> amateur rules and hence are a more specialized set of rules.
>
>

QRM sez:
As a student of both sets of rules, I disagree with Jenkins on this point. The CB rules are unique to the radio service to which they apply. There is virtually NO overlap between CB and Ham regulations. The CB rules were created specifically for that radio service. CB is NOT a "junior varsity" Amateur radio service. It stands on its own. One does not "move up" to ham radio from CB. He or she simply "adds" a ham license (and the resulting frequencies and modes).

Gary commented:
> There is nothing
>wrong, second class or otherwise about CB. It can be compared to nothing
>other than CB and perhaps FRS.

To which QRM says:
AMEN !

Hey Gary, dont take this as an insult (because most people do), but you're beginning to start your postings with comments that sound just like mine. Be careful man. The next thing you know you'll be arguing with the establishment about what the definition of the word larceny is.

"But your Honor, Mr. Smith only borrowed the $1700 he stole from the convenience store at gunpoint. He was going to replace it after his Korean War disability check came in, and after his doctor was paid for his wifes tumor surgery, however these nasty, non-understanding, police officers caught him several days later while he was on route back to the store to return the money with interest and to give a Nordstrom's gift certificate for the store clerk for the inconvenience"

Every time I have sent an amp to #12 it always comes back with a higher output. Maybe tuning is the wrong word. I just leave it to the best and I am not disappointed. If you want to know what he does; pay the price to have

one "tuned" and then look inside.
Many times changing the feed wire size, fuse scheme etc. will allow more
power thus increasing output.

Just thought I would pass this on I have used Ebay several times with
out problems and dont know what happened but I got confirmation saying
I was the winning bidder on a radio that I did not bid on. I did look
at the radio on thier site but that was it.Just wondering if I got
hacked because the only other strange thing that happened yesterday
was I got a blue screen with an eception ereror while online dont know
if this had any bearing on what happened or not and by the way it did
happen while on ebay and lock the pc up.

hey fellows,

when i go to (dont click!!!) www.coaxkid.com (don't clikc!!!!! you will crash!!!!) my netscape browser crashes as the page finishes loading. last week the site worked, this week my browser error messages and then closes. just thought i wouild let everyone know. how can you sell stuf if your site don't work.

anyway i been looking at the uniden 122xl ssb and the lil' will magnet(i work in queens ny, raido theft capital of NYC)antenna package jcre has for like 110 bucks(i think). does anyone have any experence with these products.

any recomends on a 100w amp in the 100-200 range for this ssb rig??

i like the small size of the 122 to mount perfect in the dash of my 86 volvo turbo wagon, in place of the no longer hooked up factory auido equalizer. looks like i got about 5.5" x 2" and 8-9" deep(can go wider if i have too, but i will loose my cig. lighter)

. anyone know the exact demensions of that uniden? i check unidens website and everyones elese, even talked with the boss of jcre the other day and no one has an answer to the demensions. anyone know the numbers exact?, unidens 800 operator Amy ,is sending me the info in the mail but could not tell me measurements, there in a different dept, figure that one out......anyone? sanil mail is sooo slow

and what about these export raidos? if i wanted to be ham guy down the raod and wanted to buy an ssb mobile export for under 200 bucks, any recomends on export raido, antenna and amp? for like <300 bucks?like a good start set-up... this way i could beam out on the raido

hey , let me thank everyone for the help and advice in advance.

think there is a hacker on coaxkids site?

Hey, Oris, you trying to make it look like all HAM's are angels? Hope not, take a gander at this:

"A South Carolina ham who was the target of an FCC enforcement action has turned in his Amateur Radio license rather than accept a license modification that would have kept him off the HF bands for four months.

Under a license modification imposed June 30, Whiten was to stay off the HF bands until October 25. In return, assuming no further violations, the FCC would clear its books of any outstanding FCC enforcement issues and grant his vanity call sign request. Whiten had been given 30 days to protest the license modification.

WB2OTK has run afoul of the FCC on several accounts. In late January, Hollingsworth and an FCC engineering team visited Whiten's station after what Hollingsworth called "longstanding complaints" about its operation. Whiten reportedly cooperated in the station inspection. The FCC says it's received "numerous complaints" about Whiten "regarding profanity, obscenity, broadcasting extreme racial slurs, deliberate interference and failure to properly identify."

In April, the FCC sent Whiten tape recordings of transmissions from his station made on two occasions in November and asked him to explain their contents.

Whiten responded in May. Citing privacy concerns, the FCC has not gone into details about Whiten's explanations for what was on the tapes, but Hollingsworth noted in his June 30 letter ordering the modification that Whiten had apologized for the operation of his station on the dates in question."

Guess the FCC is too busy cleaning up licensed radio operators to deal with the unlicensed CBers, eh?

Good day mate.

Well the best antenna I have ever used is a Wilson 1000 Mag mount. It has good gain and great reception. You can get it from Coppers magazine or here

http://www.copper.com

It is a very dependable antenna.
About the radio, you would need to hav the exact model and look on the internet for Mods.

Hope that helps....Doug

I have a 575m6 that has intermittent transmit sounds like it unkeys but it is working. all connections are good and battery is brand new. I am using it on a 2970 that has had modulation clipped no matter what I do even turning down mic power on radio as well as mic nothing has worked. Anyone have any ideas as how to fix problem? Oh yeah stock mic does not have this problem just want to have cleaner as well as clearer modulation.

Thanks in Advance:

Hi there,

Why dont you keep it??
Perhaps we can talk on air if you use that one.
I live in The Netherlands.
Do you think your signal will struck my antenna??

greetings,
Andr�

Hi Richard,

If this is an 18channel radio, it definately isn't like the Washington I
had years ago. Mine was 40 channels and used the uPD858c PLL. If you
like, I do have the schematic scanned into BMP format and could Email it
too you. Just Email be after 7pm USA EDT and I'll fix you up tonight
when I get home.

Cheers!
Andy

Then there was probably temporary corruption of an incorrectly registered .DLL, or permenant corruption of the .DLL and/or .EXE itself. Though, since it atleast runs, it could be the .EXE, but more than likely the .DLL. It is not his site. His site may "trigger" an "affect" caused by this corruption, though, it is certainly not his site itself.

Why waste your time with the Lil' Wil then? Go with a Wilson 1000. Though, the Lil' Wil is a nice little antenna. You could most certainly spend a little more a go with a better one. PC 122 XL is a decent little radio... I dont care much for its modulation properties, but.... just my own opinion I suppose.. (and yes, that is which the diode bias mod)

>any recomends on a 100w amp in the 100-200 range for this ssb rig??
>

$100-$200 you mean? I would say, I wouldnt waste my money. 100 watts really doesnt do much, atleast in your area. Not enough in my mind for the price you would pay. If you must, go with something bigger.

Take care.

Hank

I have an export president Jimmy CB. Is there a way to expand the 40
channels to 240 channels. (like the President James, cut a diode and push
some buttons :))
Thanks in advance

Yes. Sign the back of the check and mail it to:

Hank Aaron
4231 E. Water St.
Harrisburg, PA 17011

I will gladly purchase the radio equipment that I think you should have.

I would also, gladly keep that equipment that I buy, of which I think you
should own also...

On a more serious note... What are you looking for..? What do you want to
be able to do. $500.00 is a decent chunk of change to spend on radio
equipment. Considering... Do you want a base, or mobile? Do you wish to
talk a lot of SSB, or X channels?

Hank

Yea I know about porkbut! He is a real work of art and its about time the FCC did something about that slob! All I was doing was making people who have CB radios aware of the power the FCC has. They need no search warrant. All they have to know is there is a CB radio in your house. GO FIGURE! If the FCC is visting your in trouble for something.
Oris

I've been making some CONUS contacts and traffic has been high. I'm new to CB radio and have a question for you DX'ers. Where do you guys get the callsigns you are using? They don't seem to be Amateur callsigns, but I may be mistaken. Usually three numbers. Are these through DX clubs? Please, point me in the right direction if I should have one.
Thanks,

DoubleDown in East Texas

****

"THE ILLEGAL CB'ERS PRAYER"

O Lord.

Wipe away the whiners and criticizers.

Smite the complainers and silence the mud ducks.

Forgive them Lord, for they know not the pleasure
(and profit) that comes from high power.

Help us this day to create a multitude of watts.

Give us safe haven for our illegal commerce.

Grant us more mods for the Grant.

Keep us free from responsibility and common sense.

And let Texas Star shine forever in the firmament.

Amen.

Actually an Archer Crossbow, but it's the same thing.

$20 you come and get it, in Woodbridge, VA. It's already down on the ground.

I was just curious, I was not disagreeing with your claims, I just had two of them on my bench and the only way I could get 700 peak watts out of one them was to run the voltage to about 14.5 and hit them with a one pill, On the 43's they were doing 350,that was on 1K slug (new not surplus) and my power supply is a haus, 200 amps continuous, about 400 pounds, PC 76 on the bench.

Where did you see $16 ea ($32 a pair) I bought these same radios with
the same intent, new antennas and use out camping, fishing, hunting,
etc.... Bill's 2 way has em for 19.90ea, I got 3 for my 3 radios (got em
at www.sportsmansguide.com for 29.99ea, still not bad). Problem is I am
temporaraly stuck with using the ext. antenna jack on the side. I had to
go to rat shack to get a BNC to Phono adapter. That still has the center
conductor and the outer ground or shield. I have yet to find one that
goes from BNC to the 1/4 inch by fine pitch thread that the stock rubber
ducky antenna uses. So far I am happy with em, just need to scrape up
the right $2 adapter, or whatever that kind of adapter costs

> B. Get center load telescopic car/truck mount CB antennas, probably
> using a BNC to UHF adapter to hook into the handheld. This option,
> according to one poster, is "slightly more cumbersome" than the Maxon
> but gives "much better range."

I'm driving my parents corsica right now as I am restoring my other car,
so I have one of these hooked up to a magnet mount antenna, just a rat
shack cheepie, but it works good (dad don't want me drillin holes or
rewiring the damn thing...)

> Now, my question. Can anyone recommend a not-overly-cumbersome

antenna

My suggestion, get the WTA-1 and let me know if you find the right
adapter, and if I find it I'll let everyone know too. Good luck! Gonna
get me another for free now, thanks for the link to this outfit!!

I have seen 3 575's where the battery leads have come loose from
the circuit board or had cold solder joints. Resolder the battery leads and
see if that helps.

Oris,

Well, I don't know that I agree completely. I've read of plenty of instances
where the FCC knocked on the door and was refused entry/inspection. The result
was that the HAM operator, if I recall correctly, immediately lost his license.
By your reasoning, the FCC could enter any house at any time, since you don't
have to have any visible signs of running a station. They can knock on my door,
but without a search warrant, I'd hate it for them if they attempted entry
without permission.

And it's just not people with CB's, but also those HAM operators, porkbut <sic>
or not. I've listened plenty on 2m and 10m and heard conversations go on and on
with no identification given by the HAM operators. Isn't that against FCC rules?
Go figure.

Oris wrote:

Is English a second language for you?? Perhaps you should read and comprehend a post before you reply antagonistically or at all!! I am inquiring about the CALLSIGNS DX'ers use not the freakin' channel, Pinhead!! And let's suppose for a minute I did actually ask which channel CB'ers DX on. What's the FREAKIN problem with that??? This is a NEWSGROUP, is it not?

Please read this post slowly before you reply, Buckaroo. If necessary, have someone translate into your native language. Once you fully comprehend the text, formulate a response and post literately. Also, reconsider the urge be such a jerk in that reply.

That's right. I think that was the one with single conversion receiver and crappy double-sided pc boards. Hold your soldering iron too long and the trace lifts right up. Cheap.

Oh, also check out http://www.thomas-distributing.com/ for some cheap
1350mAh AA batteries, I bought some cuz they got over 2x the cap of NiCD
because they are NiMH and cheaper than NiCD in stores, I bought 36 AA
for round 70 bucks, and they work great plus a quick charger and a slow
charger and 8 AAA totaled round 145 but well worth it in the long run!!

There are about 15 to 20 kids in my neighborhood that live about a half mile from each other. They all have base stations and are all running powerful amps. What I don't understand is, none of them even try to talk any distance or even try to talk skip when it rolls in. My question is," why does someone need several hundred watts to talk to someone a few blocks away? All they talk about is how much interference they are causing to their neighbors.

Which is all out better, a 102" whip or a wilson or firestik antenna. My guess is the 102 whip will inheritly have better performance because it doesn't have a coil or is coiled up. Just want to see what kind of opinions I'd get. Also, where is the cheapest place to get a nice chromed 102" whip or can one make it themself, using heavy gauge steel wire...

hi there. on am most of the numbers people use are made up by themselves. on sideband 90% of the callsigns are from clubs. its important to find a good club with strong membership that will be around. one with email list and web sites and people to help is always a plus. check out the group i'm in. its one of the fastest growing and biggest clubs in the whole world (only behind SD and AT but both of those are lots of snobs) 73 tim 2-IR-082 www.irdx.org

Question:

The FCC can inspect your station.

If you are an amateur they know you have a station because of your license. However, if you have no license then how can the FCC or any other government agency have an automatic search warrant for your premiss without the knowledge of a station being present. I agree that the ownership of a CB constitutes a station which will allow the FCC to inspect. Proven transmissions that the FCC can show you are evidence of a station also.

As far as i can determine, mere possession of a CB (if known by the FCC) can be used to legitimize an inspection. However mere possession of a non CB (amateur radio) can not be used as a legitimate reason for an inspection. It does not meet the requirements for what defines a CB station, and as long as there is no evidence of transmission there is no evidence of a station. A antenna is not evidence of ownership of a CB radio, or evidence of running a station (transmitting).

My question is what is the FCC required to show as evidence of ownership of a CB station, or operation of a station before their automatic search warrant can be used.

<<<There are about 15 to 20 kids in my neighborhood that live about a half mile from each other. They all have base stations and are all running powerful amps. What I don't understand is, none of them even try to talk any distance or even try to talk skip when it rolls in. My question is," why does someone need several hundred watts to talk to someone a few blocks away? All they talk about is how much interference they are causing to their neighbors.>>

Looks like you have to live with it. Even if it means not being able to use your CB radio. What's sad is that techs and equipment dealers discourage enforcement or peer pressure that could curb this kind of behavior -- all because they need to stay in business and keep selling amps.

I'm having the same problem with a 2600 with a chip-switch.
In addition sometimes the radio will not transmit, a gentle tap to the radio
gets it going again.
My guess is a bad solder joint in the chipswitch socket.
I have several other radios, and I have not taken the covers off my 2600 to
start looking for answer yet.

Any any "reasonable hour."

>I've listened plenty on 2m and 10m and heard conversations go on and on
>with no identification given by the HAM operators. Isn't that against FCC
>rules?

Probably. The requirement for identifying at the beginning of a transmission has been deleted. However, an amateur still must ID once every 10 minutes and at the end of the "work".

> I've read of plenty of instances
>where the FCC knocked on the door and was refused entry/inspection. The

>was that the HAM operator, if I recall correctly, immediately lost his
>license.

Great words from a lady at Radio Free Ashville (NC), a pirate broadcasting facility, when being interviewed on TV:

"Yeah. The guy was in a suit and everything. But I didn't let him in and he went away."

(The station was "busted" with FCC and Federal Marshal Service personnel a few hours later).

The law says in essence that you are regulated by the FCC. If you transmit, you are subject to inspection. If the field agent is aware of your transmission times and df's your house, antenna or no antenna, and determines a probability of excess power or other irregularities, he is within the law to inspect the station. This is not to say he is given carte blanche to look at the whole house and find the heroin stash under your bed. If I can df a bad door bell transformer from a couple blocks away, right down to the closet it was in, I'm certain that the FCC with its big-bucks equipment can find a transmitter in a house with no visible antenna.

tnom@muck.net wrote:

> Question:
>
> The FCC can inspect your station.
>
> If you are an amateur they know you have a station because of your license. However, if you have no license then how can the FCC or any other government agency have an automatic search warrant for your premiss without the knowledge of a station being present.
>
> As far as i can determine, mere possession of a CB (if known by the FCC) can be used to legitimize an inspection. However mere possession of a non CB (amateur radio) can not be used as a legitimate reason for an inspection.

Transmission on ANY frequency, CB, amateur, whatever, constitutes a station, and is then subject to inspection. Amateurs certainly are not exempt.

>
> My question is what is the FCC required to show as evidence of ownership of a CB station, or operation of a station before their automatic search warrant can be used.

Transmissions of any kind constitues a station and can be inspected, but it would be unlikely if the initial data gathered indicated that the station was in compliance.

However, if you have no license then how can the FCC or any other government agency have an automatic search warrant for your premiss without the knowledge of a station being present. I agree that the ownership of a CB constitutes a station which will allow the FCC to inspect. Proven transmissions that the FCC can show you are evidence of a station also.

The rules state that you must make your station equipment available for inspection upon request. This doesn't mean they are allowed to come into your house and search for a station.

I guess if you refuse, and they still keep getting complaints about your station, then they can get a judge to issue a search warrant.

CB is used all over South America for exactly this purpose: a cheap and efficient medium distance village-to-village intercom. Although in Honduras you will likely get 'skip' from the USA during daylight hours. (Cover the kids ears)

Well, yes and no. The full quarter wavelength antenna would be presumed to be best, and it would be compared to other antennas of equal or shorter electrical lengths, if it was stationary. The rub comes when you start the vehicle in motion. Wind load on the whip forces it to arch to the rear and this changes the pattern of radiation. If you are attempting to reach a station to the side of you then this would improve the possibilities. If you are trying to reach someone in front of or behind you, then the communication abilities would be degraded.

DieselFumes wrote:
>
> Which is all out better, a 102" whip or a wilson or firestik antenna. My guess is the 102 whip will inheritly have better performance because it doesn't have a coil or is coiled up. Just want to see what kind of opinions I'd get. Also, where is the cheapest place to get a nice chromed 102" whip or can one make it themself, using heavy gauge steel wire...

The 102" whip. They look good on trucks, but not to good on cars.

>opinions I'd get. Also, where is the cheapest place to get a nice
>chromed 102" whip or can one make it themself, using heavy gauge steel

I don't think a chromed whip is made. Don't make the whip yourself,
go to Radio Shack and get one.

It doesn't mean they get to stand at the front door and you parade the various components by. They can inspect the station. If the station is on the second floor, they can go to the second floor to look at it. If you refuse entry, you are already in violation and it goes down hill from there.

>
> I guess if you refuse, and they still keep getting complaints about
> your station, then they can get a judge to issue a search warrant.

Search warrant is not required. The law states that by operating a station, you have given permission for the inspection. Since you have already given permission, no warrant is required, and if you refuse entry, you are guilty of refusing an inspection, hence, all equipment can be confiscated.

Thanks for the support!!

If anyone in Michigan, around the Kent and surrounding counties is interested,
you can email me or if you are hams, the lowell 145.270- machine 94.8 pl.
Or via cb, call on 19 for BIG KAT or alt handle, EASY WIND UP, then well set up
a channel to meet up on and eventually face to face QSO (contact)

Tony KC8EWU

p.s.> I am having comp probs so I may not respond very fast, please be patient
thanks in advance

I have no problem with a confirmed transmission. However before i
would let anyone in my house i would like to see evidence of this
confirmed transmission. Any thing other than that would not be a legal
search as far as i am concerned.

Agreed. You can't beat the new NiMH batteries. They contain more energy and do not have a memory. The only thing better than NiMH are the new rechargeable lithium batteries. They also do not have a memory but are much more expensive than the NiMH.

While on the subject, the Maha MH-C77 universal charger can not be beat. It can automatically discharge and sense the proper voltage to recharge any rechargeable battery between 4.8v and 12v. If one wants to charge a smaller voltage like the 1.5 volt cells all one has to do is buy a four battery holder and charge all four at the same time. As long as these four batteries are kept as a matched set from the beginning then you will have no problem with unequal charging.

Nothing beats the 102" steel whip for mobile use. I've tried a Wilson 1000 on the roof and the whip beats it HANDS DOWN. It's much more broadbanded than any base loaded coil antenna. The wind laying the antenna back at speed causes no significant signal loss, as the entire length of the whip radiates. Radio Shack sells the whip for $14.99, the mount is $12.99, and spring is $12.99. If you don't mind the way it looks and performance is your #1 concern, you won't be disappointed.

no!! Scanners are not allowed in most states unless you are a ham or authorized to have it in vehicle via a permit (re: emergency unit, reporter for ex)
If you do with no authorization, then your radio can be taken and thron in jail with fines.

hey, break in there one day when only one is on, tell the young jerk some other
one of them is talking behind his back, then do to another one of them a few days
later.

get the voice changing mike and listen for a few days and then using the info you
listened turn the little punks agnist eachother, slowely over a few weeks you can
make them all enemyes and they wont talk anymore.

could be done, i could do it

dino

How many watts would I need to come to the party? how many watts to have a
big radio?

CB "Callsigns" come from a variety of places. Since no skill or radio
etiquette is required, you can find them in the usual places

1. Cracker Jack Boxes
2. In the little prizes in the vending machine in the dime store
3. Use part of your former prisoner ID number
4. Use the last 3 numbers from your food stamp ID number
5. Use a few numbers off the license of yer favorite pickemup truck

You're welcome

The items you mention boil down to increases in supply voltage
and drive power.

I've talked to Dennis (aka #12) and I know what he does.
He removes inefficiencies that exist in certain amp designs.

I've provided him with information that has simplified his
task.

Dennis is not the only guy that's ever been on this newsgroup
that understands amplifiers.

If you want to view him as some sort of amplifier God--that's
your right. Just keep in mind that others (who are still
out here even though Dennis has run off) understand amplifiers.

A fella just gave me a CB and I was wondering if it's worth mounting in my truck. I was thinking of getting one for hunting and offroading in case of break down or something, and he pulled it out and handed it over.

It's a Realistic 4 watt CB with 23 channels. It has AM, USB, and LSB. I don't know diddly about what this means other than the fact that the other CB's I've seen have 40 channels. It has RF gain, and squelch, etc. I don't know much about that either, other than someone told me they were important and not always on cheap radios. I also need an antenna that will work in some ravines and riverbottoms. Any suggestions? This is for a '94 F150 4x4. TIA....

My SSB radio receives just fine. If you turn the volume up halfway it begins to squeal. Sounds like feedback or oscillations or something weird. Any ideas?

I agree with you both on that!! Its not the games, tv shows, movies or anything
like that!! People got to use common sense again!! Thats why Im planning on
writing the book(s) The Complete idiots guide to common sense!!  1&2
Second one will be common sense for the total complete Imbasile! (pardon typos)

While they are knocking is not the best time to figure out how you will handle it. Find an attorney friend and run it by him/her in advance.

Remember, the FCC comes to the fight with experience. You and I will be going through it for the first time. That makes it their "turf", unless you are prepared.

Just a thought......

with talkback you hear your own voice over the radio's speaker when you
transmit. This can be usefull if your adjusting an echo control.

Try http://www.palcoelectronics.com. Their price for the Maxon WTA-1 is around $13 each plus $6 per order shipping, and looking at old messages for this newsgroup (using http://www.deja.com) I find some good things said about this vendor. But I have never used them myself.

The reason the FCC requires you to know morse code on 10m but not 2m
is simple. The 10m band is an HF band to which you can communicate to
people in all parts of the world under certain tropospheric
conditions. The 2m band is a VHF or UHF band for which you cannot
easily communicate to people around the globe. Some people need to
study up on basic amateur radiio knowledge!

102" whip is best. You can read about firestick's claim of being 5/8 wave, or
Wilson's claim of being better than the K-40, or K-40's claim that they make
the best mobile antenna you'll ever own, etc, etc, etc. These are all good
antennas, but remember this: the longer an antenna is, the better it will work.

It has long been an ITU regulation that CW is required for a license to operate
hobby-style radios below 30 MHz. FCC rules must conform to International law.
Brandon White's post explains the propogation differences between 2M and 10M.

CB is exempt because originally the radios used crystal control (and later were
channelized). In theory, the operator of a CB radio cannot get "out of his
band" and cause harmful interference. Can you guess that all these laws were
written before the advent of "export" radios?

Will this be the classic case of having an AC box and only having 12V?
How can you power this thing with a bottle of raspberry schnapps?

It's loaded up in the back of a J. B. Hunt truck. I'm still deciding who's got the best trade. The driver's standing in my kitchen, tapping his feet and drinking coffee. He's humming, "You picked a fine time to leave me, loose wheel."

Some Amateur Licenses are VERY EASY to get now...There is a HAM OPERATOR around
here with a NO CODE TECH license, that is about as qualified as one of my
wife's birds! Now this is not to say that ALL NO CODE TECH Licensees fit this
description, on the contrary, some are VERY GOOD operators. But it is Sooooo
EASY to get! ... Joey

Most of the traffic is on the lower 23 channels, so not having all 40
isn't a big loss for a beginner. SSB users have all moved to the upper
channels 37-40, and you probably won't use it anyway until you get
more into radio. The main thing to remember is the longer the
antenna, and the higher you mount it, the better it works.
Have Fun,
CoaxKid dot Com

Another thing about CB, there are a lot of agitators out there trying
to make you lose your cool, if they succeed, you lose, if you don't
let their BS get to you, you win. Enjoy the radio, but don't take it

too seriously.

The same can be said for people who all live locally, within a few miles
of one another with mobiles. There is no reason, other than to boost
their egos. They must have the "biggest, baddest" radio system. It is
all competition. They will all try to talk over one another and other
juvenile behavior.

ETC ETC ETC

Well, Boys.....here it is, right on schedule. This time is was 29 days after the last troll. Just like clockwork. I don't know if it has to do with the phase of the moon or the troll's wife's monthly period.

To JammerHater (of that distinguished ISP WebTV):

First of all, I doubt that you really are a ham operator. If you are, you probably are brand new to the hobby. And you CERTAINLY are new to this NewsGroup. So here's some information that will help you:

1. Thanks, but we already know that it is not appropriate to transmit in the ham bands without a license.

2. And we already know that amplifiers are illegal.

3. If you don't like the language you hear on CB, don't go there. Or, change the channel and hang out with folks whose speech meets your standards and expectations.

4. When you come to CB by radio or by this NewsGroup, you "check your license" at the door. A ham license has no authority on CB. On CB, everyone is an equal. You'll find some CBers who are better operators and who have better equipment than you every dreamed of achieving.

Now, if you are simply a troll, consider the following:

The last troll attempt like this hardly got off the ground. The days of the 200-post threads started by people like you are over. We got wise after the third or fourth one. The only folks who will take the bait are newbies, and you will find that they learn fast.

In my private e-mail to you, I mentioned that I am a CBer and a ham. I've been licensed since 1961, and have been an Extra Class since 1964. I can talk your language. And I can usually spot a non-ham (or a brand new ham). Sure, hearing pirates in the ham bands is distrubing. But those folks don't read this NG. Shouting at everyone here will do no good.

If you really ARE concerned about non-licensed operators in the ham bands (especially 10 meters), e-mail me for details about a program called "Intruder Watch" and I'll give you some positive things you can do to help the situation.

Otherwise, There's the door.

QRM2000
As you leave, remember these great words from Geoge Jefferson of TV's All In

Newsgroups: rec.radio.cb
X-Admin: news@aol.com

Actually, reading the entire thread before responding is good advice at any time. How often we see answers to the original post that duplicate numerous follow-up's!
Go through the responses and make note of what you want to say which has not been addressed already by somebody else. Then, and only then, should you go back and add your remarks. Voice your support for a position, or add new information and insight.

In the case of JAMMERHATER, this will be especially important. The first five or six responses will tell him everything he needs to know, hee hee. After that, it will just be posts from folks who read the original and shoot from the hip without reading further to see if the issue has been answered already.

Or, as we like to say of these people, "Ready....Fire....Aim!"

Best regards,
QRM2000

The amp doesn't have to be very big to generate that kind of interference at a local level. From the kid's perspective though, what is it hurting to break the law? It isn't hurting anyone, right?

I have 2 of these GE units, and they don't have BNC connectors. The
antenna just screws in. Will one of your recomended antenna's work
with that? If so where do I get'em? Thanks (BTW I paid $12 each at
Egghead surplus recently)
Tom

anyone can claim anything they want......I think wilson, K-40 & firesticks are good antennas and I sell alot of them....but i don't thing they are worth the price they get for them....I run a Wilson 2000 on the wifes car. but only because i can buy them wholesale and she doesn't want a long antenna. if i had my way she would run a 102.

The top 35 things you will NEVER hear a Yankee say ever, no matter how much they've had to drink, no matter how far from the North they've wandered, and no matter how much the skunks are threatening...

35. "Oh I just couldn't, hell, she's only sixteen."
34. "I'll take Shakespeare for 1000, Alex"
33. Duct tape won't fix that.
32. Hillary was lucky to catch Billl.
31. Come to think of it, I'll have a Heineken.
30. We don't keep firearms in THIS house.
29. Has anybody seen the sideburns trimmer?
28. You can't feed that to the dog.
27. Wrasslin's fake.
26. Honey, did you mail that donation to Greenpeace?
25. Do you think my gut is too big?
24. Honey, we don't need another dog.
23. Who's Barney Frank?
22. Too many beer cans detract from the decor.
21. Spitting is such a nasty habit.
20. I just couldn't find a thing at Wal-Mart today.
19. Trim the fat off that steak.
18. Cappuccino tastes better than espresso.
17. The much rust on the car, its not safe.
16. I'll have the arugula and radicchio salad.
15. I've got it all on the C drive.
14. Unsweetened tea tastes better.
13. Would you like your fish poached or broiled?
12. My fiancee, is registered at Tiffany's.
11. I've got two cases of Zima for the Super Bowl.
10. Little Debbie snack cakes have too many fat grams.
9. Checkmate.
8. She's too hairy to be wearing a bikini.
7. Does the salad bar have bean sprouts?

6. Hey, here's an episode of "Maud" that we haven't seen.
5. I don't have a favorite college team.
4. Be sure to bring my salad dressing on the side.
3. I believe you cooked those green beans too long.
2. Those shorts ought to be a little longer, Darla.
1. Nope, no more for me. I'm driving tonight."

You're absolutely right. In order to get more dues money flowing in, I hear the ARRL wants to limit the Technician test to one question using the following application form:

NAME: Last, First, Middle

Thank you, Please make your $25? check payable to The ARRL, Newington CT and you might receive a copy of QST Magazine in the next 6 months.

PS: Dont bother calling us with real Amateur Radio problems, we are only concerned with Political and Code issues. EXCEPTION: Unless you are calling from Saccucci Cadillac in Hartford to let us know that K1ZZ's ARRL company car is ready.

Thanks again for your support.

Well
I don't think anyone of us should refuse entry by the FCC. The FCC will only make things worse. The NAL below shows proof of this. What might of been a 300-700 buc fine has been changed to a 7000 buc fine. As far as the FCC is concerned they can inspect your station anytime they like.

I just love how you guys start complaining about amateur operators doing this or doing that. The way I see it its easier to point the finger at someone else vs pointing the finger at yourself. How many of you who are complaining about some idoit ham who doesn't ID run over power yourselves? How many of you who are complaining about hams doing this or doing that operate above channel 40 or below channel 1? But yet you want to pull the attention from yourselves on to amateur radio operator. Sweep your side of the street before you start pionting the finger at others.

Now to address the fools who don't ID right. Make a log of the behaivor. Write down the date time and frequency of the activity. Then write down the time between IDs. Write down the stations call, and what they are doing. Then Send it to the FCC. I will be willing to bet if there wasn't a call it wasn't a ham. It was some CBer working out of band. If you don't like to see hams not ID then do something about it. CBers have a much better chance of getting away with stuff then HAMS do. Heck we have a guy here in Danielsville GA that is right on main street got a sign up and everything doing illeagal Mods on CB radios stealing amps and repairing amps and the FCC knows about him and nothing is being done. They have known about him for years. So if they is a ham in your community doing things wrong on the ham bands the FCC will get him if he is known about. But if there is is a CBer in your community doing things wrong the FCC is less likly to do anything. The guy in Danielsville is a good example of this.

73 and stay legal and you won't have any problems

The FCC's right to enter a dwelling is ADMINISTRATIVE LAW and not CONSTITUTIONAL LAW. This supposed right of theirs is such a violation of a persons civil rights it isn't even funny. An "electronic confirmed transmission" can be dealt in a court of law with as easy as a Troopers radar gun, a breathalyzer, or a lie detector test. Hell, DNA (which is accurate to about 7 zero's) couldn't even put OJ away. The only true confirmed transmission is when a witness is present in a room with a defendant when the illegality takes place and this same witness is willing to testify against the perpetrator in a court of law.

The FCC has been handing out fines knowing full well that the person being fined would spend more in legal fees defending the fine as compared to just paying the fine (which the FCC negotiates this fine if someone is willing not to challenge them). No-one has had the financial resources to take them to the Supreme Court to challenge this rule because if they did, it would be overturned in a heartbeat and considered as untrustworthy as a lie detector test is in a court of law.

The only time the FCC has right to enter your home looking for illegal transmitters is during a time of "War" or when under "Marshall Law" (and even this one is defendable).

Well, I'm glad you have this issue all worked out. Perhaps you should share your legal opinions with the attorney general. Perhaps you should present case law as well.

The FCC will never enter a home if there is no evidence of radio transmissions coming from the structure. If there is evidence, then said evidence is reportable to a court of law if needed. Beyond that, if there is evidence of transmissions, they have a legal right to inspect. If you want an iron clad guarantee that they won't knock on your door, get rid of your radio or seal it in plexiglas so nobody can use it. If you transmit, you are subject to inspection.

A while back there was a question within the FCC that the NAL amounts were being assigned without adequate research so a number of them were set aside. It turned out that the fine structure had been understated by quite a bit, so now, all NAL fine fees are >>consistent<<, based upon the violation, and substantially higher than before. Beyond that, all questions have been addressed regarding the equity of the fee amount, so the NAL's are sticking.

Why would any one clip the modulation diode in a 2970?   I resolder every one I
find clipped, That radio has excelant audio & is cleaner on a scope with that
diode intact.   TBOLT25

Hello All
I am looking for the mic pin outs for a Midland C.B.
Model number 77-104.
I am trying to retro fit a radio shack mic to this radio.
Thanks in advance.

i would find out what the input drive requirements are for the amp.
if it requires, for example,a 50 watt drive and you are driving it with 25 watts your output will be lower.
i had a magnum 2000, (125 watts am, 200 watts ssb), which drew 25 amps max.
if yours draws the bulk of the max. output of your alternator and you run the a/c and headlights also, this will affect your output too.
i had that amp in a 1987 yugo,(ok stop laughing), which had a 55 amp alternator and a 1.1 liter shoebox with 4 mice.
if i keyed up on max., it really lugged the engine down. the pres. 2510 and amp had more horse power than the engine did.
i hope this helps.
jeff

Hey, Oris, just tossing some examples of your beloved HAM's violating FCC rules. You don't like it being tossed back at you? Then don't toss the crap at us.

I read your web page, or at least up until I couldn't stomach the drivel anymore. You get what you deserve as far as CBers chunking HAM operators illegal activities back in your face. You don't like it, stay off the CB forums.

So go sweep your street, and when there are no more illegal HAMs, then step across and see if you can start sweeping our side.

And no, it was a legal transmission, because the 2nd station identified, the 1st never did. And I just know that no honest HAM would talk to a non-HAM on a HAM band, right?

Oris wrote:

> Well
>
> I don't think anyone of us should refuse entry by the FCC. The FCC will only make things worse. The NAL below shows proof of this. What might of been a 300-700 buc fine has been changed to a 7000 buc fine. As far as the FCC is concerned they can inspect your station anytime they like.
>
> I just love how you guys start complaining about amateur operators doing this or doing that. The way I see it its easier to point the finger at someone else vs pointing the finger at yourself. How many of you who are complaining about some idoit ham who doesn't ID run over power yourselves? How many of you who are complaining about hams doing this or doing that operate above channel 40 or below channel 1? But yet you want to pull the attention from yourselves on to amateur radio operator. Sweep your side of the street before you start pionting the finger at others.
>
> Now to address the fools who don't ID right. Make a log of the behaivor. Write down the date time and frequency of the activity. Then write down the time between IDs. Write down the stations call, and what they are doing. Then Send it to the FCC. I will be willing to bet if there wasn't a call it wasn't a ham. It was some CBer working out of band. If you don't like to see hams not ID then do something about it. CBers have a much better chance of getting away with stuff then HAMS do. Heck we have a guy here in Danielsville GA that is right on main street got a sign up and everything doing illeagal Mods on CB radios stealing amps and repairing amps and the FCC knows about him and nothing is being done. They have known about him for years. So if they is a ham in your community doing things wrong on the ham bands the FCC will get him if he is known about. But if there is is a

Come on Dave, if Radio Shack can't make a 102" whip correctly, then
they might as well give up.

OH NO! I'm agreeing with Wildcat!
He's right, the FCC has no right to enter your place without your permission unless they have a warrant or during other such emergencies he listed below. However if you refuse to allow them to inspect your station and they have to get a warrant you're going to be in lots of trouble. Part 95 requires that you allow the FCC to inspect your station at any time. No you didn't sign anything but when you keyed your microphone you agreed to all the rules and regulations of Part 95.

Well you just raised more questions than you will get answers, and then you'll get more personal opinions than facts. Lets face it a well intentioned opinion is still shit when it comes from an ass, and there is plenty here. My personal favorite for a base radio is the DX 2527. My first pick for a mobile is a toss up between an OLD 2950, HR2510, or Dx 88hl (galaxy.) Any way for what it's worth that is my opinion, and I own all of them. I've tried allot of the others, still own some, but those are my favorites. Good luck and Happy Hunting....

Kevin,

Well, I agree with you on almost everything. What if it's the guy next door that's the culprit and not myself?

Going into a hypothetical, we both use our sheds as radio rooms, and they're side by side on the property line. Can the FCC (or anyone for that matter), determine which antenna is transmitting the alleged illegal activity or using the alleged illegal device? If they can, no problemo. If they can't, well then the FCC could pursue actions against the wrong individual.

The best solution, of course, is not to have any illegal equipment and not engage in any illegal activities. Of course, if the guy next door is doing something illegal and the FCC knocks on my door instead, then what?

Kevin Muenzler WB5RUE wrote:

Tony,

We are in Southgate Michigan (in the downriver area) about 15 miles west of Detroit. According to the map I would estimate the distance to be approximately 120 miles. Also please note we are expecting the H-50 44'0" back in stock within the next few days.

Thanks for thinking Palco Electronics,

Tony

The price is a little high for a rig that is 2 generations old. You can buy
a new IC-2100H of TM-261A for $199.95 and get a year warranty. Besides
none of the will work on 27 MHZ.

So they search both sheds. If yours is the one with the linears, etc then you're in trouble. If it's your neighbor then he's in trouble. Simple as that. The FCC can use recorded data, oscilloscope readings to determine which radio (with or without a linear attached) was doing the transmitting. Since all modern CB radios use phase locked loops it is pretty easy to track down a culprit. Every radio has its own "phase in" signature. So if it's your neighbor it will be pretty easy to determine that. If it's you it will be pretty easy to determine that too.

> Well, I'm glad you have this issue all worked out. Perhaps you should
share
> your legal opinions with the attorney general.

The Attorney General doesnt know her ass from her elbow. Just look at Waco, Ruby Ridge and similar situations. Just because something is an Administrative law somewhere doesnt means its Constitutonally correct. Something only becomes "Unconstitutional" when its gone through the court system up to and including the Supreme Court. Until then its just another societal guideline.

>Perhaps you should present case
> law as well.

I dont have to because there isnt any (yet). When the FCC practically abandoned enforement 13 years ago the only major problems in the private (non-commercial) radio sector were with CBers. Any CBer who was caught did not have the financial resources (or the gumption) to fight the FCC so there was never any case law ruled upon. Now its 13 years later and some Hams have become a problem (jammers), and "organized" government enforement has just resumed. There are those within the Amateur Community who have the financial ability to fight the FCC, hence case law will eventually be written. Just wait until W1WCR and his crowd get going. They will be going balls to the wall with the FCC.

> The FCC will never enter a home if there is no evidence of radio
transmissions
> coming from the structure. If there is evidence, then said evidence is
> reportable to a court of law if needed.

Any, and I mean any electronic evidence is practically inadmissable in a court of law. This situation is exactly like a wire-tap. A taped wire-tap alone cannot be used as justification to convict. A wire-tap along with WITNESS corroboration is the only thing that is acceptable. The conversation on the wire-tapped recording is used to "set the stage" and can only corroborated by a cooperating persons testimony.

>Beyond that, if there is evidence of
> transmissions, they have a legal right to inspect.

They do not have the right to inspect. There administrative rules say they have a right to inspect however they do not possess the right to enter a property without a court order. Many of them have been getting away with rapping on someones door, and that individual has let them in, but without a Search and Siezure Warrant (which has to be issued by a Federal Judge) they cannot legally enter ones domicile.

>Beyond that, all questions have been
> addressed regarding the equity of the fee amount, so the NAL's are
sticking.

The NAL's are sticking because the defendants arent fighting them.

> the alleged illegal device?

This is exactly the reason why the FCC needs a physical witness to corroborate the electronic evidence. They cannot go busting in to a house violating your civil right to enjoy your real estate because you may in fact NOT be breaking the law.

Your hypothetical situation reminds me of the Connecticut State Police. Some years ago they decided that they had the right to use a seldom used State Motor Vehicle Administrative Law as justification to set up random road blocks on New Years Eve in order to catch drunk drivers. They detained and tested 100's of innocent people who were not drunk thus violating their Civil Rights.

Someone guy with big Onions sued them and took the issue all the way to Connecticut Supreme Court of which the State Police walked away very embarrassed.

The FCC cant trample on the rights of law abiding citizens by "taking a shot" that they'll catch a bad one. In the situation of 2 individuals living next door to each other, they would have to wait until they actually had a breathing witness who was willing to testify or one of the parties would have to volunteer to have their station inspected in order to eliminate his station from the equation.

The point is at what point are you deemed to be keying a mike? Isn't
it the FCC's responsibility to show evidence of this before any Part
95 rule can be applied? If you are not keying, and the FCC does
not know for certain that you have a CB, then you are not a CB'er,
and no part 95 rule applies to you. Specifically the inspection rule.

I was trying to figure out a way to run a halfwave on my car. The first thing that came to mind was a telescopic antenna. Has anyone ever heard of this being done and would it work? Any ideas on how to build one would be appreciated.

I'm sorry for being incomplete....not just oscilloscope readings. Although oscilloscope readings can be used to determine oscillator characteristics there is what is called "fingerprinting" that uses "oscilloscope type" readings to look at the phasing in of the oscillator. Every radio is slightly different due to the different component characteristics.

In Maryland, we have pick 3 and pick 4 twice daily; keno every 5
minutes; lotto; the big game (multi-state); and scratch-offs. If
you want powerball you can drive to Virginia or Delaware or the
other surrounding 4 states. They all have their own games.

I only buy a single ticket when the jackpot gets big. I'm no sucker.
CB radio and the lottery have a lot in common: You've gotta Pay to Play!

This is correct. When you tune to the AM signal (called zero beating)
you will be able to tune in AM and understand what is being said. It
does not matter if you are on lsb or usb. It works the same way.

> Conversely, if I hear a conversation on
>LSB I can also hear it on USB or vice versa. Is this a normal occurrence
>for SSB radios?

Yes it is normal but you can not understand lsb when you are on usb
and vise versa.

>The manufactures advertise that you can use 120 different
>channels with a SSB radio but from what I am hearing on my unit there are
>still only 40 channels.

40 is all. For example channel 40 is considered to be 27.405 mhz

AM = 27.402 - 27.408
LSB = 27.402 - 27.405
USB = 27.405 - 27.408

LSB and USB are components of an AM signal.
The other component of a AM signal is the carrier centered at 27.405

All of these modes can be intercepted by a receiver that is tuned to
the correct frequency. When you take your clarifier and tune lsb to
a area above the normal 27.405, you will then start to invade the
usb portion of this channel. When you do this you will hear a
unintelligible usb signal if one is present.

I was going to say the same. If they have to search both sheds then
that in itself is proof that they are going on nothing. Therefore a
search at this point is illegal.

It is a three wire. The tip is the PTT, the ring is the mic terminal, and the sleeve is ground. Use the mono 1/4" plug.

i don't know about refurbished radios but i bought an SWR meter for my mobile.  It
was a PDC 5 cuz i just wanted somehting small and compact.  But i got it and the
package was all damaged liek it was opened b4 i got it or like someone had it and
returned it b4 i got it.  I hooked it up and it didn't work.  And there were 2
knobs missing on it.  I'm kinda thinking that they do sell refurbs or products
that
people sent back and were never fixed.  You should try Thomas Distrubuting out of
Paris, IL.  They have better quality products.  They are a little more expensive
than copper but its worth it.  They have mod and conversion kits too.

Whoever said I do not have my husbands equipment for sale is a liar. I think he wants me to lower my prices so he can talk me into letting all of it go for free! I still have a lot left, and a lot that I will give for FREE to the right person who wants to use it and NOT RE-SELL it! Please call if interested.

Use between a 45 and 100 ohm, About a 60 ohm if you use a roadking 56, and around a 100 ohm for a stock mic, up to around a 200 ohm for a power mic, Also you can solder a resistor from pin 4 on the backside of the mic plug to board ground (square metal can) and simply switch the wire in and out of the circuit for switched talk back.

Good Luck!

VK3NDS Amateur Radio Web Site now has NEW PAGES for users.
The site is also now FULLY SEARCHABLE.

URL IS: http://www.tbsa.com.au/~dsimp/

The new pages are:

Astronomy; Amateur Television; Antique Radios; Antennas; Band Plans;
CW; Home Brew; Propagation; QRP; Radio Clubs Listing; Radio Mods;
Six Metres+++.

The other services remain including Hams Home Page Listing, DX'ers
Page, Contesting, SWL/Scanner/Monitoring Page, Ham Software & Ham
Study, plus hundreds of radio related links.

Just depends upon who you need to talk to. On flat land with open spaces, 2 meters can go 60 miles or so with a little luck--40 for sure (assuming 50 watts). 6 meters is also useful in this range but the equipment is a bit scarce. Actually a bug catcher would probably put out a better signal for 11 meters than most CB antennas, but I doubt that too many guys have tried to use one for that.

Your radio is operating correctly,where did you see 120 channels? Galaxy and Copper use such idiotic numbers but I expected more out of Uniden.
  By the way if someone is talking on SSB and you are on AM you will not understand them unless you are physically very close.

Before ordering from any internet or mail vendor, I check out what
folks on Usenet are saying about it.  The search facility is use for
this is http://www.deja.com.

Based on what I read there, The Rebate Company appears to be a
legitimate outfit.  However, as with any internet company, questions
```

can be raised about how profitable it is and thus how long it will remain in business.

Also, read what they have to say at http://www.rebateco.com/info.html. Taking their words on that page literally, I interpret the Rebate Company as committing themselves to pay the rebate out of their own funds if the manufacturer renegs. Pretty impressive, if true. As for how long it takes to get back the rebate, the page last mentions advising the Rebate Company of a problem if the rebate has not been received after 14 weeks.

Steve Eisenberg   Wynnewood, Pennsylvania U.S.A.

P.S. Thanks to all for the many informative replies to my original post in this thread. However, I still have not seen any recommended model numbers of cheap, not too heavy, center load telescopic CB antennas. All suggestions are welcome. Please don't hesitate to respond just because of not knowing how your favorite cheap center load telescopic can be fit onto a GE handheld--I can probably rig up an adapter myself if need be.

Hello, all;

I have a few things for sale. E-mail me if you, or a friend, are interested. Here goes:

1.) Sadelta Echo Master Pro desk mic. Controls for modulation, echo volume, echo speed, roger beep on/off. Modulation meter. Great sound. Excellent condition. $55+ shipping.

2.) PDC antenna switch. 3-positions, 1500 watt rated, never used. $20+

3.) Hustler mobile antenna. Base loaded coil. Med. duty spring/36"
stinger. Needs mount. $15+

Write to manmusic@earthlink.net   Thanks for looking. Pat

Of course, they have to prove you have a CB in the first place. The mere presence of an antenna on your roof doesn't mean you have a CB. Let them prove it before you show them anything.

>

There is no absolute magic number of a frequency, but there are two limits that I use as a guideline when discussing radio communications theory. The lower limit is the 40 meter band. 40 will work local stations on out to several hundred miles during the day. All this on a hundred watts SSB using an 8ft antenna mounted on a rollbar. At night the range extends to thousands of miles, subject only to static and interference from foreign broadcasters.

The upper limit is 20 meters. 20 will work from a few hundred miles on out to 12,000 miles. The noise level is lower, and antenna size is still 8ft overall. 20 is terrible for local chats, so for that it's back to 40. This is where ham operators have a much better shot at a usable frequency, because we can move up or down on the bands as ioniospheric conditions change. My mobile (100 watts, ssb) can operate from 80 meters to 10 meters. Contacts range from local, to Russia, China,and more than a hundred countries on various bands. At home I cover the same bands, same power level, but have some bigger and better antennas.

My favorite band? Has to be 10 meters. When it's open, 5 watts will talk anywhere in the world, clean and clear. I like building antennas, and 10 meter stuff is small enough to fit almost anywhere. And you can cut down CB antennas to work great on 10!!!

Ditto! This is the best response of all of them. Only thing I would add is that the "perceived SWR" is affected by coax length but that has nothing to do with actually changing the reflected power back to the transmitter. The best length is 1/2 wave length including consideration for coax velocity. At 1/2 wave length you will see the actual SWR as it exist at the antenna feed point.

Gary Danaher wrote:

Gary: a bugcatcher (or screwdriver for that matter) is a quite lossy antenna when used on 10 or 11 meters. Shorted turns in a big coil on the bugcatcher create LOTS of loss. Try it some time using a good Field Strength meter at a 1000 ft distance.

My 10 meter mobile antenna is a 7/8 inch by 102 inch long aluminum tube, using a custom mount with a 1/2 inch bolt. It's big, ugly and tall (13 ft overall height.) BUT there are no coils, traps, gadgets, or do-dads to reduce performance. Bandwidth is from below 27 to 29 Mhz at less than 2:1 swr. And will handle the full legal output available to me of 1500 watts, if I need it!!!

You wont need an amp if you have a Good antenna, Like a Wilson or a K40.
One thing is make sure its got a good match to the radio, for best output
strength and signal should also be good for the others. A good radio if you can
find it for not to much money is the Cobra 19 Ultra. I had one and its a GOOD
little Radio!!

The noise level is lower, and antenna size is still 8ft overall. 20 is terrible for local chats, so for that it's back to 40. This is where ham operators have a much better shot at a usable frequency, because we can move up or down on the bands as ioniospheric conditions change. My mobile (100 watts, ssb) can operate from 80 meters to 10 meters. Contacts range from local, to Russia, China,and more than a hundred countries on various bands. At home I cover the same bands, same power level, but have some bigger and better antennas.

My favorite band? Has to be 10 meters. When it's open, 5 watts will talk anywhere in the world, clean and clear. I like building antennas, and 10 meter stuff is small enough to fit almost anywhere. And you can cut down CB antennas to work great on 10!!!>>>

I have 2 2950s. I have never had a radio report say I have white noise in my signal.   Probably your D104. That is a very sensitive mic and it is probably picking up noise. Your antenna has nothing to do with the noise. Do you still have the stock mic? You might want to ask for a radio check comparison using the stock mic. Have any mods been made to the radio? I wouldn't do any of the advertised mods except for adding a clipping speech processor. Let me know if I can help more.

You can Reach that and Further on CB with no prob!! Ive talked to Canada via skip one night with one station about 100+ miles away on stock Robin in truck connected to a Radio shack antenna!
And that was next to the house on the south end!!

Exactly! Then you could be bored to death reading all those BS contest results, and looking at photos of rich people's Ham shacks! Of course, this is how QST manages to stay THICK, while all the other Ham rags are getting thinner and thinner! Take all that contest crap out, and the damn thing probably would be about 1/8 inch THIN! I worked, and confirmed all 50 States on 40 meter CW, many years ago. I sent ARRL a letter, (before they had E-mail) and asked them how I should go about getting my 'WAS' award...You know what they said? "OUR RECORDS SHOW THAT YOU ARE NOT A "MEMBER" OF ARRL. ONLY MEMBERS ARE ELIGIBLE FOR THE 'WAS' AWARD"...Then it went on with the "WHY DON'T YOU JOIN" BS, etc...They didn't even bother to explain how to get the award, even if I DID "JOIN", (buy QST, in other words). So, as far as I'm concerned, ARRL=BS... Joey

Hello Gary: I'll say this again "Now that's one I would like to see"

Gary Danaher wrote:

> Jay, this is not brain surgery.

Agreed, but it ain't like falling off a log either. Any time Electromagnetic
Measurements
are taken, there are always variables that can and will throw a monkey wrench in
the gear
box. That result in bad measurement data. This where a experienced technician or
engineer
need to be aware of the these variables.

> DFing a stationary signal is very easy to do and with modern technology,
fingerprinting
> a signal is a snap.

I am familiar with Radio Direction Finding (RDF). And there are times you can very
accurately detect a transmitters direction, with the Angle Measurement Equipment
(AME)
function, and there are times it will leave you in deep left field without a clue.
If you
believe the RDF's accuracy in the AME, and you have experience with the equipment,
and
know the range equation, (or just the free space loss of a signal, and the 6dB
double/half range octave fact) you can get very close with the transmitters
location, via
the AME and a estimated distance.

"fingerprinting a signal is a snap" I'd love to hear about fingerprinting a
signal.
Please do tell.

> DFing a mobile signal is more
> challenging, but if you have 2 or more guys doing the job, anyone can be found.
>

Ok.But using your low tech equipment to detect a transmitting antenna, among a
group of
antennas, across town, and then detecting and identifying the transmitting
antenna, that
is within other antennas, as close as 4 feet apart........ Like I said, I'd like
to see
that!

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah
ways
from the fillin station.

A "perceived match", as you call it, which would be indicated by
placing the swr meter at the radio instead of at the antenna, DOES
indicate the reflected power to the transmitter. This is not a
fictitious reading. True, it may not be an accurate indication of the
antennas as a load by itself, but it does indicate the total of all
the factors that go into creating a proper load for the transmitter.

Yippee!!!! After forgoing radio comms for over a year due to my busy
life and theft of my last 2510, I today purchased a President Lincoln.
One thing I notice different then the schematic is that it's now using
a mrf455 final, moved to the underside of the main circuit board, with
the original driver transistor in its original spot. Is this
new?...or is it just the difference between the 2510 and the Lincoln?
Also, I don't think the mods could get any easier....(oh wait, it
could be as easy as a 2950, but diffference is.......this radio
WORKS... <g>)
Any thoughts?

Greetings Gang,
I need help/info on a Golden Eagle 750...I took it the shop today
and found out the plate xformer is out..Mike thinks it's 700volt at 1.25

amp but isn't sure..I need to make some inquirees and find out..It has
(2) 20LF6's driving (4) 20LF6's..IP meter goes to 1000ma..Does anyone
have the xformer ratings or know what they are? .Whatever it is 700v or

whatever, it'sCT. RD, my neighbor has a schematic for the GE1000. It has

(2)20LF6's driving (6) 20lf6's and has a low/high stage..Low is 500v and

high is 1000v..Anyhow , this is a nice amp and I plan on keeping this
one..
The xformer leads are plug in.It reminded me of removing a Alpha

xformer..
Thanks ...Rusty

Firestiks are all under $25. 102's cost $12. I think Firestik makes good antennas at great prices. As for Wilson and K40 go, the Anttron 1700 puts both of them to shame and at $21 is a best buy!!!

Well I don't know about location but every where I been that has had testing it is a single fee per session. Most will give at least two test for one fee. On several occasions I've seen people go from non ham to general at one session for one fee. ARRL got nothing in most that I have seen because it was different organizations doing the testing.

One other thing what does that have to do with CB?

If you are an amateur when you applied for your ticket you gave the FCC to inspect
your station, no warrant needed.
If you operate a CB that is different, but it would be a lot easier in the long
run
just to let them in and say you didn't know any better and cut your losses.

Oh geez, if a CB'er has to provide records, how will a FRS user provide records?

Im a liar? Funny. You know why. I called that number personally. Here you go again to attempt to harrass this woman. Seeing that you are a total newbie, and speak like an 18 year old punk, I think your credibility as compared to mine is well... down the shit drain dickhead. Now, you pissed me off.. and seldomly have I gotten to the name calling, finger pointing games... but no one! calls me a liar when they are a liar themselves... You are gonna be royally FUCKED my friend. Say goodbye to your account... this will be done either through the system that aol has... or..... well... either way, your account is done! Shouldnt have used your real account you little arrogant prick!

Hank

PS - Sorry to all, but, my wife, my money, my integrity, and my food are all things I hate being fucked with... Soo.. Sorry...

Info from the FCC's web site:

$7000 CB FINE

The FCC has approved a $7,000 fine against a Little Rock Arkansas Citizens Radio service operator identified as Steven Craig Burseof. This for violation of Section 95.426 of Commission Rules. Rule 95.426 states that a C-B radio operator must make his station and its records available for inspection anytime that request is made by a representative of the FCC.

No thanks... I only "smoke"  35 or 40 amp fuses. The smaller ones give me a
headache.

What is the approximate band-width of a Moonraker 4?  I figure about 2 MHz,
but I could be wrong.

On Fri, 06 Aug 1999 14:40:00 GMT, Gary Danaher <gdanaher@flash.net> wrote:

*First, it is swr, not swr's.
*
*Second, the length of coax has virtually nothing to do with the actual
*swr of an antenna-radio match. Trying to simplify this, a particular
*radio frequency will be perfectly resonant on an antenna whose electrical
*length is the exact length of the frequency's wavelength or a particular
*fraction thereof, e.g. 1/4, 1/2, 5/8. That said, if the antenna length is
*too short or too long for this particular frequency in question, the swr
*will rise. In a base station situation it is fairly easy to create an
*antenna which has totaly flat swr (1:1). In a mobile it is sometimes a
*challenge but is achievable. The location of the antenna on the vehicle

*to a great extent determines the swr. It interacts with the metal
*structure. Given your particular situation, it may not be possible to
*have a flat swr on a vehicle but it doesn't have to be perfect to work
*well. A 1.5:1 isn't bad.
****

The length of coax has no effect on the match between the antenna and the feedline. Length of coax will play an effect on the match between the transmitter and the feedline if the antenna is not the same impedance of the transmission line. By adjusting the length of the feedline one can reflect the impedance of the antenna such that it will match the desired impedance of the transmitter. However from a system point of view this is truly not an optimal practice. This is because the SWR still exists at the antenna. It is more desirable to adjust the length of the antenna to obtain a suitable match or introduce a matching circuit composed of lumped constants, ie inductors and/or capacitors, to obtain a match between the antenna and the feedline. This is the most critical junction. This is where most of the power is lost.

For mobile installation, the more metal of the car body under the antenna the better. This will allow the ground losses that are associated with mobile installations to be reduced. In mobile installations the ground losses can approach a significant portion of the radiation resistance of the antenna. In short vertical antenna the ground loss resistance can even exceed the radiation resistance of an antenna. Thus making the ability to match the antenna very difficult.

Agreed that a 1.5:1 SWR is adequate. The difference in radiated power from 1.5:1 tro 1.0:1 is minimal.

Regards
James

*Remember that the higher the frequency, the shorter the antenna. Check
*the swr on Channel 1, Channel 20, Channel 40. See if it goes up, down,
*whatever, and figure out where it is most resonant and if it isn't, where
*you want it to be and adjust the length accordingly. Be aware that an
*open door or trunk lid will affect the swr.
*
*Mobile antennas use the structure of the vehicle as a ground plane. It
*might be necessary to move the antenna to a different location on the
*vehicle to achieve a good match.
*
*Most antennas have provisions for making adjustments. Avoid cutting on it
*until you have determined it is a last resort.

******************
```

Essentially the coax length adjustment is a means of matching the transmitter to the feedline. It does not do anything for the feedline to the antenna match. When dealing with systems where the antenna and/or the treansmitter are not the same impedance as the transmission line, you have two area to match. The transmistter to the feedline and the feedline to the antenna. The later is more difficult.

*
*This is correct. When you tune to the AM signal (called zero beating)
*you will be able to tune in AM and understand what is being said. It
*does not matter if you are on lsb or usb. It works the same way.
*
*> Conversely, if I hear a conversation on
*>LSB I can also hear it on USB or vice versa. Is this a normal occurrence
*>for SSB radios?
*
*Yes it is normal but you can not understand lsb when you are on usb
*and vise versa.
*
*>The manufactures advertise that you can use 120 different
*>channels with a SSB radio but from what I am hearing on my unit there are
*>still only 40 channels.
*
*40 is all. For example channel 40 is considered to be 27.405 mhz
*
*AM = 27.402 - 27.408
*LSB = 27.402 - 27.405
*USB = 27.405 - 27.408
*
*LSB and USB are components of an AM signal.
*The other component of a AM signal is the carrier centered at 27.405
*
*All of these modes can be intercepted by a receiver that is tuned to
*the correct frequency. When you take your clarifier and tune lsb to
*a area above the normal 27.405, you will then start to invade the
*usb portion of this channel. When you do this you will hear a
*unintelligible usb signal if one is present.
****

tnom:

Good analogy. In communications the term channel is loosely defined as the medium in which intelligence is transmitted. Thus in the nature of good marketing let us tripple the number of channels for a SSB/AM transceive. They are by the loose definition of a channel somewhat correct. By stating the LSB and USB are different channels is loosely correct. They seldom really explain that the 80 channels that y ou get with SSB have to coincide with the 40 AM channels. In this aspect the 120 channel advertisment is very misleeding.

Regards
James

In theory, I would agree with you, these devices are less than useless as a means of speech processing. But you must remember that the overwhelming majority of these 'echo' mikes, boards, boxes, etc actually DO have a legitimate use. Properly adjusted, they can (and do) provide a rather enjoyable enhancement to communication. Trouble is, I rarely hear one that is properly set. Instead, 90-95% of every one I have ever heard in over 25 years of CB has been cranked up to the point of unintelligibility. I have never understood why so many people, particularly truckers (of which I was one for a while) seem to find that 'good buddy' sound so desirable. In my opinion, they sound like a Mexican radio station. As a final comment, let me add this: It has been my experience that most anyone who ever used such a device seems to sound EXACTLY the same way, i.e. possess that 'twang' in their voice that would indicate, shall we say a southern or rural point of origin. So prevalent is this practice that for about the first year of my trucking life I was convinced that the same person was following me all over the country!

I don't claim to understand the reasoning behind the use of these devices as we know it today. My best guess is that many operators have a 'more is better' mindset when it comes to these things.

That's my dimes worth.

Phil

The FCC can inspect your station at ANY time. Its in the part 95
rules. Even if your perfectly legal!

I don't think this means they can search your home without a search
warrant, which must be issued by a judge.

Sorry, but when you bought your CB it came with a copy of the part 95
rules. If you bought a used radio without the rules, then you would
be the one who is ignorant and without excuse for not knowing the
rules.

>Regardless, hypothetical #2 (don't you just love hypo's? ;-)). I'm not running

Don't worry, the FCC would not be that stupid. They can easily tell
that the transmission are not eminating from your home.

The Little Wil' is a great antenna for the size. You'll probably have
to cut the whip about 1/2" or 3/4", but you should be able to get the
SWR down to 1.1:1 on channel 19, I did.

Is your power supply regulated? If not it can introduce an annoying hum/hiss into your signal.

Does your radio have NB/ANL built in? If it does turn it on. If not, then your cars electrical devices are causing all kinds of RFI. It may be a job for the dealer. Ask them if there is a service bulletin for you make. They may have a fix for it.

I'm afraid you MISUNDERSTOOD what I wrote Stan, but this really doesn't surprise me, as this IS a CB NG...I was talking about additional TESTING FEES for applicants that 'FAILED' the test! Notice that I mentioned "WAITING to try AGAIN"! I made no reference to applicants taking tests for HIGHER CLASS, after PASSING the lower class test!

>ARRL got nothing in most that I have seen because it was different
>organizations
>doing the testing.

I didn't say anything about ARRL getting anything from testing sessions, either! I was talking about the content of their RAG, and their rules about awards...I don't know what you read, but I think you need to read it again!

>One other thing what does that have to do with CB?

It has NOTHING to do with CB radio. And being that it doesn't, what provoked you to either READ it, or try responding to it? It was a response to a question someone asked on this NG...You know, it is that kind of attitude that keeps MOST CBers where they are at...Joe

I have a thirty foot push up pole and was wonderng if anyone knows il I
can buy more sections for it or is there a way to just add a piece of
pipe at the bottom to make it taller say forty to fifty feet
ps antron 99 on top

<<Hey Rhooligan i think you should move back to Boston and help out Chuck on WZLX.May be it will bring you back to you roots! You know like pirate radio and all those fines that WBCN were a custom to from the FCC.>>

Why? All I'm saying is all you nice folks who are just having fun and enjoying talking to your neighbors on CB have nothing to fear from the FCC. So don't let the agitators spook you with disinfo.

>rules. Even if your perfectly legal!

Part 95 rules deal with people that have a CB station. Does your neighbor have a CB station? How about your uncle? The point is that in order for part the part 95 inspection rule to come into effect the FCC must know you have a CB or are transmitting. They do not have a right to search your uncles house.

Hello all,

Does anyone know if there is a newsgroup for Australian CB radio??
Our CB scene is pretty different and unique compared to other places
in the world and I would be interested to know where these people
might be congregating on the net.

Yeah, yeah before you say it, we do have our fair share of assorted
geese, jibberers and cretins populating our bands here too!!

Cheers,

Greg   --- >   Canowindra, NSW, Australia.

I have just had an GME TX3000 fitted in my car today, it came with a 6dB and a 9dB antenna, the area that I live in has undulating ground and only 1 mountain range about 60 km away with a repeater station on it and today I was able to pick it up quite easily with both antenna's....

So which one would be the best for this type of undulating land the 6 or 9 dB antenna??? I have had it mounted on the side of the bonnet...

Cheers.... Bob

I have purchased a '99 Tacoma extra-cab,and it has the dual airbags, I'm currently running a President Lincoln in it, but want to put an amp in also.

What should be a "SAFE" limit on the power without blowing the bags? Thanks for any help.

Hello Radio Pandemonium: I'll add them to my "What to say on the 2
meter repeater List" But before I can talk on 2 meters, I got to get my
echo mic ah working. And once I get the guide wires tuned for the set of
beams, the Swr's well be good.

I am glad we had this chat.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the
road ah ways from the fillin station. .... A good friend to Big Bob
famous CB'er and flossifier. Big Bob always says: "Ya nevers no whos ah
goin-ahaa show up, or get out of jail early, so's ya better keep extra
beer and linear tubes on hand"

  Never had a CB, never will. Got into amateur radio via shortwave listening actually.

Tom

I have an old Midland 77-225A I want to install in my '98 Dodge Caravan with minimal hassle. I saw a thru-the-glass antenna at Radio Hack for ~$49, but have no experience with them. Do they (a) work reasonably well and if so (b) where is the best place to mount it. Alternatively, what is a good magnetic mount antenna?

Next question- I have a Midland accessory that ties the CB output into the vehicle speakers. Installation calls for routing the car radio output into the accessory box and then out to the speakers. The diagram shows 4 wires in from the car radio (+ and - from Left and Right channels) and 4 going out (+ and - to the Left and Right speakers). I have front and rear speakers, and pulling out the car radio I find a total of 6 wires going out to the speakers. Any suggestions?

Thanx for any assistance--

If you want reasonable perfomormance then no, they aren't good. If you want to get maybe 1 or 2 miles front and back on the highway then it will suffice.

Radio Shack does make a pretty decent 54" magmount whip antenna for $38.99. You probably won't even need to adjust it. However you can obviously get the best by going with a Wilson 1000, but this antenna is very tall. On top of your caravan it would probably hit things. The wilson Little Wil' will get you out reasonably, but careful placement on the vehicle and proper tuning of the antenna are required. You'll probably need to cut the whip by 1/4" increments until you get the SWR reading the be equal on channels 1 and 40. At this point your channel 20 SWR reading should be the lowest overall.

Greetings all:

Well, they have been around for a while now. Has anyone figured out how to put a talkback into a Pres. George? The usual methods are ineffective. Talkback speakers don't work. I like the George a lot, but it just does not seem to be as flexible as some other radios.

TIA
Phil

Howdy,

My name is Robert, and I'm new to the CB hobby. I've had a General Electric 40 channel CB for about a year now, a buddy gave it to me thinking I'd be able to use it. Finally got it hooked up in my 1986 Chevy Celebrity, using a magnetic maount antenna on the roof of the car made by Diesel. I also had to get a new microphone, the old one was shot, there was no modulation coming through. you could hear the CB click when you pressed the button, but no voice or sounds came through. Picked up a Northstar mic, and it's been working okay for me. Now, when the guy at the shop hooked my CB up to test the new mic, he said that it had previously been peaked and tuned, and that when he spoke into the mic, the CB was pushing around 20, 22 watts. I merely observed him testing it, I didn't see the meters or anything of that nature. got home and tested it on channel 2. I was picking up my neighbor up to about 1-1.5 miles from his house. And if this is supposedly pushing 20-22 watts with normal voice, I should have been able to pick him up from a farther distance than that. I don't know if it's the terrain, or what? Any comments? I'm more into this for a learning expirience. Oh, and my handle is Baron, and I normally run channels 2, 19, 22, but I do occasionally just surf the channels. So if you're in or near northeast Ohio, the Warren area, go ahead and give me a shout, the handle again is Baron.

Thank you in advance,

Robert

The FCC's right to "inspect stations" is very different from a search of the "search warrant" type. The FCC has the right to inspect your radio and radio gear, period. Nothing else. If there was a pound of dope on your kitchen table as they walked by to get to your radio, they could likely do nothing about it at the time because they were there on the premise of inspecting your radio, not searching your house for drugs.

The bottom line is, if you don't believe in or accept the FCC's rules for operating a CB, then get rid of your CB's. That is what a Judge would most likely tell you. As the rules are stated, the FCC DOES NOT need a search warrant to inspect your station. You could cry foul until the cows come home, but you wouldn't have a leg to stand on in court.

These rules have been around since the beginning of radio. Now all the sudden when the FCC decides to make examples out of a few illegal operators, everyone is screaming about it. Contrary to perception, CB is not a free-for-all radio service. There is always that possibility that the FCC will knock on your door someday. If that happens and you are running illegal equipment, you will most likely pay for it. Like Beretta said, "don't do the crime if you can't do the time." But faced with that situation myself, I think I would cooperate with them and beg forgiveness rather than slam the door in their face. It would most likely be much cheaper in the end.

Jim

The potential power output has nothing to do with its ability to hear a
weak signal. The radio may or may not have a preamplifier which would
boost the weak signal to the point that you might hear it more easily.
Meters are not all made alike. The stock radio should do 4 watts on AM.
In the unlikely possibility that it is producing 20 watts output, it
probably won't do it for very long. Check to see how warm the radio is

getting after you have keyed it constantly for a minute or two. It is also possible that if the technician was measuring in line with your antenna and not to a dummy load, and if this is the case, and if the antenna wasn't tuned properly, part of that 20 watts is likely reflected energy, so take it with a grain of salt until you determine the guy knew what he was doing.

Robert Guthrie wrote:

> My name is Robert, and I'm new to the CB hobby. I've had a General Electric 40 channel CB for about a year now, a buddy gave it to me thinking I'd be able to use it. Finally got it hooked up in my 1986 Chevy Celebrity, using a magnetic maount antenna on the roof of the car made by Diesel. I also had to get a new microphone, the old one was shot, there was no modulation coming through. you could hear the CB click when you pressed the button, but no voice or sounds came through. Picked up a Northstar mic, and it's been working okay for me. Now, when the guy at the shop hooked my CB up to test the new mic, he said that it had previously been peaked and tuned, and that when he spoke into the mic, the CB was pushing around 20, 22 watts. I merely observed him testing it, I didn't see the meters or anything of that nature. got home and tested it on channel 2. I was picking up my neighbor up to about 1-1.5 miles from his house. And if this is supposedly pushing 20-22 watts with normal voice, I should have been able to pick him up from a farther distance than that. I don't know if it's the terrain, or what? Any comments? I'm more into this for a learning expirience. Oh, and my handle is Baron, and I normally run channels 2, 19, 22, but I do occasionally just surf the channels. So if you're in or near northeast Ohio, the Warren area, go ahead and give me a shout, the handle again is Baron.

Browning Mark IVA..Works very good. All tubes 100%. Has extra channel
mods, 2 different length pings, has been aligned on transmit &
receive.
Radio appearance is about a 9 outta 10. Comes with stock Browning
desk
mike. Also have a Mark II desk mike, but has a bad element i believe.
Looks good and has the original stand, but doesnt work. Will throw it
in too.
Now the bad news...Someone has put 2 mini switches next to the mic
jack for the extra channels. Doesnt look bad, but I dont like drilling
holes in a radio. Also, the cover for the transmitter has a dark spot
on the top. Looks like someone set something on top of it that was
hot.
Radio has a LOT of modulation and swing and the receive is very good.
Very clean inside and out. I have a very good set of Mark III covers
if someone would like them on the 4A instead, or if someone needs
them,
will sell them seperate for 40.00. Also have a power transformer for a
Mark III for 40.00.
Also have orignal Mark owners manual and sale literature.
If interested in any of the above, I'll take 400.00 + shipping for the
4A.
Please reply VIA e-mail.
Thanks,
Rick

I don't write a dissertation for every problem. But I like to help out.

> The question simply implied that when he keyed up, that the voltage would
> drop and stay there, and he was wondering if a large capacitor would help,
> which in this case, it would not.

This is wrong. And this is what I was trying to tell ya, without personally attacking you. Large storage Capacitors are used with the (High Power) Stereo Audio Amp crowd. These large Storage Capacitors will in fact improve the voltage regulation at the amplifier. Thats the job of a capacitor, is to take current to charge, and then it will try to maintain the voltage level, by either taking current to charge the capacitor, or give current to the load to maintain the voltage level. It will work, but how well, and will it justifies the cost of the large storage capacitors is another story. But people have reported to this news group that the large storage capacitors connected at the amp, do increase the output a small amount on SSB. I am sure if the capacitors where large enough, and one had a proper Peak reading wattmeter, some difference could been seen on AM. I would like to experiment with that.

Thanks for the polite response. What I am trying to say is that although these large capacitors may be able to smooth out these enormous changes in voltage when the guy keys, they are not going to hold the voltage for more than a second or two and that isn't going to help much in this situation, hence, the idea of using capacitors to maintain a high voltage simply isn't going to work for the guy, and yes, he should consider using a good battery, perhaps a second isolated battery, to maintain the voltage. Beyond that the price of the capacitors and the time needed to do the electronics would outstrip the cost/time it takes to install a battery. So my original question of whether he had confused the capacitors with a battery should stand. Yes I am stubborn, but I really don't think it is going to work for the guy. If he has a good alternator and a good battery, he should maintain adequate voltage. Beyond that, he likely has no need for an amp of that size but I suppose that starts another argument.

If you're meanig by this statement that your neighbor could only HEAR YOU 1.5 mis away, then I'd say you may want to look into a better antenna.
If you could only HEAR HIM that far away, then it could be his setup is not getting out very well, or again, you may want to look into a better antenna. Radio Shack makes a decent little magnetic antenna that has what looks like a 3" diameter spring at the bottom, or Wilson makes the model 1000 magnetic mount. The Wilson is considerably more $, but is a better antenna.

But do you re-charge that person for the testing fee?

The guys (the FCC not VE's) up at the Custom House in Boston (where I took my test 25 years ago) charged the testing fee for every test taken yet lately I hear in Providence they sometimes let it go by only charging a one time fee.

Thanks for the input. I'm just going the basic route, as I'm doing it as low-buck as possible. Mark could still hear me from 1.5 miles away, I couldn't. Mark has a Cobra 25 model with a permanent-mount Firestick on the front of his 1993 Dodge Dakota. He routinely talks with people in Greenville, Pennsylvania, which is about 15 miles away from our houses. (we're next door neighbors). Wha price am I looking at for that Wilson 1000?

Thanks for the input.

Robert

I had the displeasure last of listening to amateurs on the Liberty Net last night (3.950). In addition, while these guys where trying to hold their weekly net, I heard other Hams playing music, white noise, farting sounds and a taped 60 year old radio skit from Amos and Andy in an attempt to block the broadcast.

Im certainly glad to see that not only CBers have this "supposed" propensity the perform illegalities. In a few short years if sure these guys will self-change the public's stereotype of Amateur radio operators because its the bad apples that usually set public perceptions.

Brian Little was last week accused of breaking into a cigarette machine.
His lawyer argued that he was looking for 20 players............

Notice to all Employees....
Sometime between starting and quitting time, without infringement on lunch

periods, Coffee breaks, rest periods, storytelling, ticket selling, holiday planning, and the re-hashing of yesterdays tv programmes we ask that each employee finds time for a work break. This may seem rather radical but it may aid steady employment and assure regular pay checks
(Genuine from Speilman Chevrolet Co of New York)

There was a travelling circus going from town to town offering �100 to anyone who could make one of its elephants lie down. At first there were no challengers, but at one performance an enormous Irishman wearing huge hobnailed boots said he would try. The trainer agreed and the Irishman went up to the elephant, took aim, and buried his right toe cap into the elephants rear quarter. With a huge screech the elephant keeled over in pain and the Irishman claimed his �100.

At the next town the trainer offered the bet and the Irishman again came foreward and won the money. However at the next town he was getting worried about the amount of pain his poor elephant was being subject to so he offered �200 to anyone who could make his elephant nod and shake his head. The big Irishman again came foreward and whispered in the elephants ear " you remember what happened to you last time, dont you". The elephant nodded. " Well you dont want me to do it again do you.....?"

A white horse goes into a pub and asks the Barman for a whisky...." Hey thats a coincidence",says the barman, " we have a scotch named after you". " What, Eric", replied the horse.....

How to say no in 17 words.........
"well place your name on our file and if anything develops we'll get in touch with you"

Jeff, please tell me, how much time do you spend on the CB radio? If the
answer is none, I cant imagine why someone who would not spend any time on
the CB hobby, be so concerned about what is happening with that particular
hobby.

Does your self ordainment also cover the FRS and GMRS hobbies as well, thus
making you a "full spectrum" interloper? Judging by your email location, I
would think that watching bikini claded women would make for much more
interesting time fodder than worrying about what mischief CBers are into.
Another suggestion to you might be to actually get involved in the
correction of the degradation of your own hobby (Amateur Radio) before

worrying about what the guys buying the $49 radios at Radio Shack are doing.

Someone else (a long time Ham) recently told me that opening the window in your shack at least once a month, thus letting some fresh air in, helps considerably as well.

But, you have actually given up that right by virtue of transmitting on the CB frequencies. You give up that right by way of Part 95.

Just like in most States when you get your Drivers License, you are agreeing to take a test to determine your blood alcohol level (BAL) if you are stopped/arrested for DUI. You have given up your right to require the Police to obtain a search warrant before obtaining the evidence, your BAL, which will be used against you in a Court of Law.

I'm not saying wether it is right or wrong, but it makes you think!

Gary- good answer and technically correct. There is lots of stuff preached and practiced on CB AND car audio that doesn't wash in the light of day. Capacitors for high power amps is one of them. A couple of Walmart $25 batteries will provide LOTS of amps at 12 volts, and if ya need more, just series/parallel them for 24 volts at a gajillion amps!!! If the current drain to charging duty cycle is very low, there is no need for much more than a 100 amp alternator. Just takes more time to charge the batteries up.

Sent: Sunday, August 08, 1999 6:41 AM
Subject: CB Help

I am wiring up a Cobra 10 Ultra AT On my Motorcycle and would like to mount a button up on the handle bars in a little box to key the mic and then use the mic in my headphones (from a small battery operated intercom) to talk on the cb. What I need is a wiring schematic that will allow me to activate the mic for the intercom when the button is out and then deactivate the intercom mic and activate and act like keying the mic for the cb when the button is out. Is there anyway you know of doing this and if so where can I find the switch that will do it. The cb takes a 5 button plug for the mic. and I have a spare mic that I can use to wire it all up with. If I have to use a small toggle switch in the box I can. Reason I want to be able to do this is for ease of operation and so I can keep both hands on the handle bars at all times.

Thank you very much for the help
Daniel Sherman

I have a browning golden eagle with a 80mfd ping. It's the oringinal noise maker, but most people say that it's very annoying. I did install a dpdt switch and a 20mfd cap.

I picked up two older radios at a Garage Sale over the weekend, and was wondering if anyone could tell me anything about them, and perhaps a $-value of what they might be worth to a collector.

First is a Lafyette Telsat SSB-50 mobile. I would say it is a 9 out of 10. Missing mounting bracket, but the bracket knobs are still attached to radio. Unsure if they are the originals. They are rather large, and completely metal, not the plastic type that comes with modern radios.
No manual or paper work.

Second is a Johnson Viking 352 mobile/base. I would say an 8 or 8.5 out of 10. No mounting bracket, or knobs. I don't know if the unit originaly came with it, but the radio is a mobile, and has a base stand where you can set the mobile unit onto. The base has a built in speaker and power supply you hook the mobile unit up to, effectively turning it into a base radio. No manual or paper work

Both units are 23-channel SSB radios. Any comments or information is welcome.

Wondering what is out there that compares to the Starduster I used to have.
I'd appreciate feedback on omnidirectional antennaes out there that
perform equivalent to or better than the Starduster.

Thanks,
Ken

Can someone tell me if these 2 radios are similar. Is one better than
the other. Is it a "bigger" job to add 11 meters to the 2600 than 2510?

thanks,
Jeff

The through the glass antennas are ok for CB only if you need to talk to people immediatly around you. You can usually get the SWR's to an acceptable level, but they won't work more than a couple miles at best.

As far as having your CB routed through your stereo speakers, here's an easier solution: Buy one of those CD adapters that look like a cassette that you plug into the headphone jack on the CD player and put the "cassette" in the casette player. Plug the end of it into your speaker jack on your CB, and it'll come out of your speakers, just like if you had it hooked up to your CD player. I do this all the time.

Your best bet is to use a larger alternator .There are many companys out there that make direct factory high cap.alternators for all brands.You are only doing 400 watts so you could up grade you present alternator without the trouble of adding a second alternator.Powermaster makes 200ampers direct bolt in's for all american cars and stinger makes nice 200ampers for the jap cars.Some people run a bank(6 or more) of large 1.5 stiffing caps in place of batterys if you have enough alternator. Take care 1200~~~~!~~~~

Kevin Muenzler, WB5RUE wrote:

> What's not fair about Part 95? Because it doesn't let you run just as much power as you want? Because it doesn't let you modify your own equipment as you like? Because it doesn't allow you to transmit on any but the allocated 40 channels? It's there to protect the services along side of CB like ham, medical, and control equipment that use the area around 11-meters.
>
> The rules regarding skip and power wouldn't be needed on UHF but since CB was meant to be a LOCAL means of commination and skip does occur on 11-meters the rules had to be put there because the FCC KNOWS that if the rule wasn't there people would run just as much power as they wanted and would try to talk to other states, interfering with that areas LOCAL communication. Not that the rules have stopped it now....
>
> The reason that 11-meters was chosen back in the 1950's was because UHF and VHF equipment was extremely expensive to make. There were no UHF transistors back in the 1950's and very few would work up into that range. Those that would were EXTREMELY expensive.
>
> If EVERYONE would use the allocated 4 watts output then 11-meters would be a much more civil place to communicate. It was back when I was big into CB in the middle 1970's before it went crazy. YES I know that 4 watts will still skip, I've talked all over the world on 5 watts using 10-meters but with very low signal strengths on the other end. An S3 or S4 noise level (skip noise) can be tolerated for local communication much more than an S9 noise level like what exists much of the time now. Yes when I got into CB there were those who ran 100+ watts. But when you turned on the radio you would hear one or two from other points of the country not hundreds.
>
> Yes, I agree CB is the "lost child" of the FCC but it's not the fault of the FCC.

Well, it was the fault of the FCC. The FCC should have kept up the high standards that they createdwhen 11 meters was taken away from Amateur Radio.

> If the FCC would have been able to charge $5 for a license it wouldn't have had to drop the license requirement in the first place because it would have had the funds. If Congress hadn't passed a law that said the $5 was "excessive" then the FCC would still have the funds to enforce the rules on the books. If the guy can't afford a $5 license fee that covers the entire family for five years then how's he going to afford $50 or $100 for a radio? The reason that a person can't get across town using a stock radio is because of all the other idiots out there running 50 or 100 or 500 watts so that they can get across town. It's a catch-22 type situation.

In mt town, CB is hardly if ever used anymore. Only between 2-4 contacts a day

> I agree that 11-meter CB is out of hand and should be dropped altogether. But what do you do with the five million CB radios that are out there now?

> Do you have a "trade-in" program or something? If Class D CB was "dropped"
> it would become more of an area of anarche than it is now. It's already
> been "dropped" anyway. That's why Congress is dropping it into the hands of
> the local cops.

these are called stiffening caps.
the general rule of thumb for AUDIO amps is 100,000 uFD per 100 watts output.
i'm not sure what the formula would be for rf amps but i would guess it would
be the same if you were transmitting ssb as the caps. only work for peak bursts
of power output/draw.
if you are transmitting am, the caps won't help you as the amp will draw the
caps. down and keep them down as long as you key up with the constant load of
the amp.
if you are talking fm, the same holds true.
if you only talk am or fm, you may want to look into a bigger power supply or
alternator.
good luck.
jeff

Just to clarify a point. There is no waiting period to re-test for a failed test. As long as the examiners have a new test to give you they can re-test the applicant. I agree that my statement "non ham to general" may have been misleading.

My friend took his amateur radio written examination on a computer. So you could
go on foreverrandomly
selecting a test if it's generated on a computer. Now I call that scary :)

I have one  newcomes never been out of the box, only used
once. In perfect shape, minor crack in display.  It's a real
steal, I'll sell for $350.00 plus shipping inside the CONUS.
Paid $169.95. You better hurry and get this before you read
it.;-)

We got the same thing.

Heard eBay is losing much money. Too many scams. Users are leaving left &right. eBay offers no help etc.

One reason is that family members are unlicensed and can utilize the ham gear.
CB and FRS are ideal for keeping family activities coordinated.

Wildcat <wildcat@tp.net> wrote:
>Hey Jeff, I dont see you posting information on the Ham newsgroups every
>time a licensed Amateur gets busted.............what gives.

That would be redundant; there are others already posting such information
(and I'm glad such postings appear).

>More Hams than CBers have gotten busted since Riley got hired.

I believe the FCC is targeting hams over CBers for a variety of reasons:

*The trouble-makers are an embarrassment to the US and jeopardize US
spectrum allocation within the ITU;

*Amateurs are entrusted to be self-policing -- when that trust is
violated, it hurts all hams and casts a shadow over our 100-year history;

*Amateurs have been tested on regulations and are supposed to meet
(minimal) international standards, thus we're held to a higher standard
of operation than CBers; the trouble-makers are fully aware that they're
in violation of the law, yet flaunt that fact -- the interference they
cause is intentional which makes them an inviting target for the FCC;

*In many cases the trouble-makers have been fingered by law-abiding
amateurs, so the FCC already knows their identities and locations.

>Why aren't you posting than little tidbit of information?

Again, anytime a ham gets busted, there are more than enough notices posted on here (usually in the form of an illegally reproduced ARRL bulletin). But it looks like Newsline is back, so that will be an additional source of FCC activity against trouble-makers on the ham bands.

>It seems that the only time you post to the CB newsgroup is when a fine is
>levied against a CBer (which is rare) or when you feel CBers should be
>reading the Part 95 Rule and Regulations, which you place a FAQ in front of
>the posting.

That's part of my monthly FAQ posting sequence. Glad to see you're reading that stuff. Emails regarding the posting of the CB rules have been favorable.

>Were you hired by the U. S. government as the official FCC
>media spokes person?

Nope. Just one of the rec.radio Usenet FAQ volunteers, trying to make these NGs a valuable source of information. Want to join us?

>Please enlighten us.

I hope you're enlightened now.

But you're correct -- I don't hang out on rec.radio.cb, for most of what I hear on the CB band is embarrassing. Many of the operators talk in such a strange manner, screaming into their mics saying all sorts of weird things. I do have a CB on my sailboat (along with a VHF marine band radio) -- we have a large fishing fleet here in the islands (operating on Channels 22 and 23). There's always a fishing boat within hailing distance in case assistance is needed (and fishermen don't scream and say weird things on the air -- their conversations are of a normal manner).
(At the same time, if a fishing boat goes aground on a reef, you can be sure pleasure boaters who are able to assist will respond; these waters can be dangerous so everyone helps everyone else.)

If the price is right....it is neither the best or the worst, but if you
really want to operate 10 meters, get yourself a used Kenwood or Yaesu
and you will have a real radio, not one of those toys. You know you need
a license for 10m, right?

The FCC has introduced a new testing requirement for all internet users.

If you own a personal computer and you don't want to access the internet, then you can use your GUI based operating system without taking an passing any tests.

However, if you are going to be logging on to the internet you must learn TCP/IP and be able to issue at least 5 commands per minute to a command line interface style operating system.

Makes about as much sense as requiring people to know 5 WPM of CW to talk phone.

No the FCC can arrive at your door with an explanation that shows that they know that you are transmitting.Then they can arrive with a search warrant and the sheriff. Anything less than solid knowledge of a transmission does not justify a search warrant.

You have to be a CB'er in order for a part 95 rule to be used!!!!!!!

In other words the FCC has to has solid knowledge of your ownership of a CB radio. Or knowledge of a transmission.

In other words again, let's assume your neighbor does not own a CB. According to you then.........................

" A Station Inspection can happen at anytime at the FCC request. If you don't give permission as per Part 95, then you can be fined. Then it would be up to you to prove your innocence in a Federal Court of Law. Good luck!"

Tell that to your neighbor when the FCC wants to enter his premiss.

Or like me, they hold fast to constitutional rights that protect a citizen
from search and seizure without due process.  Due process inludes obtaining
a search warrant.

Is there a was to convert a 2600 to the CB freq with out the chip switch chip?
I looked on the PCB and pins 34 and 35 are not connected together.
I don't need the Xmit as i need to just listen sometimes during construction hang-ups.
I would appreciate any help

Greetings Gang,
I need help/info on a Golden Eagle 750...I took it the shop
today and found out the plate xformer is out..Mike thinks
it's 700volt at 1.25 amp but isn't sure.. It has (2) 20LF6's
driving (4) 20LF6's..IP meter goes to 1000ma..Does anyone
have the xformer ratings or know what they are?
The transformer is center tapped. RD, my neighbor has a
schematic for the GE1000. It has (2)20LF6's driving
(6) 20lf6's and has a low/high stage..Low is 500v and high
is 1000v..Anyhow , this is a nice amp and I plan on keeping
this one..The xformer leads are plug in.It reminded me of
removing a Alpha xformer..
Thanks ...Rusty

I predict the following will be a result of this posting:

1. RHOOLIGAN will reply with severe paranoia.

2. RHOOLIGAN will think we will satisfy him by reply to his reply to this message.

3. RHOOLIGAN will list all possible replies making it seem as if he belongs to 1-800-PSYCHIC.

Let me know when I am right.

Hank

I saw either DaveMade page or X-force was going to be offering cap banks you
may mail them and see how they are coming with their work in this area.
These caps have been successful with the instant peaks in audio systems such
as a sub woofer hitting a low. I think the cost is considerably more than an
alternator/battery upgrade. A 100 amp alternator, good battery and minimum 8
gauge wire/good grounding should handle the power levels you are speaking
of. 400 watts peak should be drawing about 30 amps.

Woops!! Forgot to add most of these work!
If anyone knows anything on the radios or has used them itd be great!!
I have included Model numbers of radios and the Type number
If anyone knows where I could get manuals, its be great! If poss a spot to
purchase SAM's (reprints)

>>I think while your in there spreading coils you should also tighten up all
>>those loose screws in those little square cans....

Dont do it!! As it has been said IT can cause more trouble than its worth!!
As for the Cans, those you dont want to touch as they are used to align the
circuits and if you touch them, most times you can kiss the radio goodbye or
will have to get it realigned so it operates right!!!!

A new angle on an old troll. I predict the following responses:

1. Incoherent agreement. Lots of mispellings.

2. Brief spurt of ham hatred and ARRL bashing.

3. Hams respond with spirited arguments.

4. Peacemaker attempts to point out there is good and bad in hams and CBers alike.

5. Profanity and personal threats made to me.

6. Further ARRL bashing. Examples of corrupt hams given.

7. Hams point out poor CB practices.

8. Incoherent, confused post from WebTV user.

9. Call to both factions to come to their senses and bury the hatchet.

10. FCC rules posted.

11. FCC rules disputed.

12. Government blamed.

13. Gun owners respond with 2nd amendment arguement.

14. Keydowns blamed for CB problems.

15. Personal threats made to me. More profanity.

>This is fine and dandy but the whole thing is prefaced on inspection
>of radio station. What makes a radio station? How does the FCC
>determine you have a radio station?

By DFing your signal. If you have an antenna up more than likely you
transmit.

>If i was a electronics repairman and/or electronics enthusiast and/or
>electronics collector does that mean i have a radio station? Does that
>mean my house is open for inspection? It does not.

Silly questions....

>A radio station is one that transmitts and/or is licensed (amateur) or
>unlicensed (CB). One of these factors has to be known to the FCC
>before they can enter a premiss.

That's right, that's why they DF the sigs.

A good old fox hunt! But made easy by the illegal stations...

Did you guys know that the echo effect on rf signals increases the range by 20 miles? And with an A-99 maybe even 30 miles? But wait that's not all..... if you act now you can learn the hidden secrets on how to turn all knobs that say "gain" on the mic and radio wide open. Add side band to it and you can talk all the way around the world and back to yourself. This is the best way since nobody else will talk to you.

You may want to read this:

"7. Under � 303(n) the FCC has the "authority to inspect all radio installations associated with stations required to be licensed by any Act, or which the Commission by rule has authorized to operate without a license under Section 307(e)(1)." 47 U.S.C. � 303(n). This definition expressly includes CB radio stations as those that the FCC is authorized to inspect. Likewise, under � 95.426, "[i]f an authorized FCC representative requests to inspect your CB station, you must make your CB station and records available for inspection." 47 C.F.R. � 95.426(a). Thus, an FCC agent does not need a search warrant to inspect a radio station. See Norfolk Southern Railway Company, 11 FCC Rcd 519 (CIB 1996) (the right to inspect a station is one of the cornerstones of the FCC's ability to ensure compliance with the Communications Act and the Commission's Rules). Pursuant to 47 C.F.R. � 95.402(a)(1), Mr. Farlow, as a CB operator, had the responsibility to be familiar with the CB rules and to comply with these rules. "The Commission expects its licensees (including CB users authorized by CB Rule 4, 47 C.F.R. � 95.404, to operate without an individual station authorization) to be familiar with those rules that govern the class of station they operate. Claims of unfamiliarity with rules cannot be used to justify mitigation of penalties." William J. McCray, Jr., 9 FCC Rcd 1897 (FOB 1994). As such, the violations of � 303(n) and � 95.426 were willful.[1] "

I guess the real question is how many hams have CB radios or have had in the
past?

To a lot of hams that came after 1959 the answer to that question would be Yes.

CB was and still is a inexpensive radio service that most hams have tried and either put up because they found that it was too limited, too noisy or too many people spewing four letter words. Other hams still use CB radios will use them in addition to their ham setup (I am in the second group). My own personal view as a ham and a person that likes radios is that CB is another radio that I have access to use. I dont usually monitor it but do bring it out on occaision to chat with others. I also view Family Radio Service in the same light and I am waiting for prices to settle there before getting a pair of FRS.

Hey Jeff, I dont see you posting information on the Ham newsgroups every time a licensed Amateur gets busted..............what gives. More Hams than CBers have gotten busted since Riley got hired. Why aren't you posting than little tidbit of information?

It seems that the only time you post to the CB newsgroup is when a fine is levied against a CBer (which is rare) or when you feel CBers should be reading the Part 95 Rule and Regulations, which you place a FAQ in front of the posting. Were you hired by the U. S. government as the official FCC media spokes person?

Please enlighten us.

>
> The FCC can inspect your station at ANY time. Its in the part 95
> rules. Even if your perfectly legal!

You are confusing what is law and what is not. The FCC does NOT have the "RIGHT" to enter anyone's home without a FEDERAL WARRANT. The FCC can ask to INSPECT a station of a CBer. If that CBer refuses they can go in front of a judge with criminal evidence and tell the judge that the CBer refused an inspection.

If that judge decides that the CBer refused the inspection, and based upon the FCC's evidence presented to him, then a warrant can be issued. It is at this point the the FCC has a "RIGHT" to enter the dwelling to inspect the station.

Using a CB radio does not give the FCC the "RIGHT" to enter someone home. Using a CB gives them the right to "INSPECT" which is to very different things, which have different results.

I noticed when my amplifier peaks at over 400 watts, the voltage drops
to around 12 - 11.5 volts. Has anyone ever considered using one of
those large capacitors used in car stereo sytems (ie."Street Wires" and
"Phoenix Gold")? The capacitors are rated at a maximum of 20 volts.
Does this mean they supply a constant 20 volts, or whatever your maximum
output is on your vehicle's electrical system (ie. 14 volts). How large
of capacitor would I need to sustain 14 volts at a 50 - 60 amp draw?
The capacitors come in 1/2, 1, 1 1/2, & 2 farads.

What are your parameters, what swr are you willing to transmit at,  a 2:1
swr maybe 1 mhz either way of the center freq  you have it tuned for. I
would assume it is not real broadbanded.

What's not fair about Part 95? Because it doesn't let you run just as much power as you want? Because it doesn't let you modify your own equipment as you like? Because it doesn't allow you to transmit on any but the allocated 40 channels? It's there to protect the services along side of CB like ham, medical, and control equipment that use the area around 11-meters.

The rules regarding skip and power wouldn't be needed on UHF but since CB was meant to be a LOCAL means of commination and skip does occur on 11-meters the rules had to be put there because the FCC KNOWS that if the rule wasn't there people would run just as much power as they wanted and would try to talk to other states, interfering with that areas LOCAL communication. Not that the rules have stopped it now....

The reason that 11-meters was chosen back in the 1950's was because UHF and VHF equipment was extremely expensive to make. There were no UHF transistors back in the 1950's and very few would work up into that range. Those that would were EXTREMELY expensive.

If EVERYONE would use the allocated 4 watts output then 11-meters would be a much more civil place to communicate. It was back when I was big into CB in the middle 1970's before it went crazy. YES I know that 4 watts will still skip, I've talked all over the world on 5 watts using 10-meters but with very low signal strengths on the other end. An S3 or S4 noise level (skip noise) can be tolerated for local communication much more than an S9 noise level like what exists much of the time now. Yes when I got into CB there were those who ran 100+ watts. But when you turned on the radio you would hear one or two from other points of the country not hundreds.

Yes, I agree CB is the "lost child" of the FCC but it's not the fault of the FCC. If the FCC would have been able to charge $5 for a license it wouldn't have had to drop the license requirement in the first place because it would have had the funds. If Congress hadn't passed a law that said the $5 was "excessive" then the FCC would still have the funds to enforce the rules on the books. If the guy can't afford a $5 license fee that covers the entire family for five years then how's he going to afford $50 or $100 for a radio? The reason that a person can't get across town using a stock radio is because of all the other idiots out there running 50 or 100 or 500 watts so that they can get across town. It's a catch-22 type situation.

I agree that 11-meter CB is out of hand and should be dropped altogether. But what do you do with the five million CB radios that are out there now? Do you have a "trade-in" program or something? If Class D CB was "dropped" it would become more of an area of anarche than it is now. It's already been "dropped" anyway. That's why Congress is dropping it into the hands of the local cops.

(I wound up going out of town after placing this add last month - rather than attempt to respond to the old inquiries, I'm placing the add again...)

All equipment is in excellent cond and works fine - no surprises....

1. Drake R4-B receiver - xlnt cond - works fine - no known problems with MS-4 spkr (spkr has extra front headphone connector and indicator light) - $240.

2. Cobra 2000 Base radio - xlnt cond - works fine - still stock! very nice - with extra spkr - $350.

3. Cobra 2000 Base radio - xlnt cond very nice - slight transformer hum - transmits great - mod'd with extra freqs, echo & variable output - with extra spkr - $325.

4. Robyn GT-7C Deluxe CB (23 chnl) Base and mobile unit - works fine - mobile slips into very nice wood base unit for base operation (with clock). A sought after unit...$150.

5. RS Pro 90 Trunk Tracker Scanner - xlnt cond - with stock ant. - works fine - $100.

6. Grant XL CB - xlnt cond - works fine (with stock hand mike) - $100.

7. Hallicrafters S-118 SW receiver - xlnt cond - tube set - works well - $75.

8. Hallicrafters S-120 SW receiver - xlnt cond - tube set - works well - $75.

9. Texas Ranger 606F mobile CB - xlnt cond - works well with hand mike - (digital frequency readout) - stock - $125.

10. Two extra Cobra 2000 speakers) - xlnt cond - $50 each.

Will add more as I get time...

Inquiries welcomed -

John

Caps only purpose is for quick power surges. If the power supply for your
amp drops only on the first word spoken then a cap might help, but if the
voltage drops for the whole use then a cap won't help.

The voltage only drops off when it peaks at over 400 watts. There
should be sufficient power provided by an auxilery battery and 4awg
wire. Will the capacitor sustain the voltage during those peak output

```
bursts of modulation?  I'm not sure, but isn't the re-charge rate of the
capacitors almost instantaneous?

```

I keep hearing the word search. The FCC conducts Station Inspections. A search requires one of 2 things: 1) Your permission or 2) a search warrant. A Station Inspection can happen at anytime at the FCC request. If you don't give permission as per Part 95, then you can be fined. Then it would be up to you o prove your innocence in a Federal Court of Law. Good luck!

You should point your browser to the fcc forfeiture page and read some the stuff stupid people do. A couple pirate stations--one from a college kid who said he would rather pay a fine than give up his transmitter--RIGHT!, and Taco Time, who after getting caught using an unlicensed transmitter to take orders, just changed the frequency and thought nobody would notice. Finally, the guy in Florida who ran a pirate station for 2 months. Told the agent that the guy he bought the equipment from had told him it would be ok, and that he could run that station until the fcc sent him a 'warning' letter. Yes, there was a cb operator who refused inspection of the house, and had a radio in his truck for which he also refused inspection. There should be an electronic Darwin award for folks like this.

What do you think of NorthStar mics? That's all I could afford for now, and I'm running it on a General Electric 40 channel that's been peaked and tuned. According to the meter the guy hooked my CB onto, it was pushing 20 watts, but I'm not sure.

Gary your technical incorrectness is starting to be most apparent. If your going to stir the pot here on the CB ng, then do it with whit, style, charm, class, and being technical correct is a must. Its like the channel agitator coming on the local CB channel with a weakie - squeaky mobile station, it just doesn't work. Maybe I can give you some pointers?

Hello Pencilpusher: I have heard that the large 1 Farad and larger capacitors, do seem to help a little on some amps. But I think that if you using SSB it may help some. But I wouldn't think so for AM. Might be worth a try, ah?

The double edged sword here is that when the amp draws a lot of current for a instant, as it will on SSB, then the capacitor will try to maintain the higher voltages, for the amount of time it has in its charge, but then then capacitor will take current to charge itself back up to its original charged state.

What is the current rating of your alternator?
What size wire do you have feeding the amp?

The real way to keep the voltage up during a high current draw time, is to have a high current alternator, and at least 4 or 2 gauge wire running from the battery to the amp for both positive and negative. And even then your gonna see some voltage drop. Some of the Big Straps have a separate alternator to power the amp.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

This is fine and dandy but the whole thing is prefaced on inspection
of radio station. What makes a radio station? How does the FCC
determine you have a radio station?

If i was a electronics repairman and/or electronics enthusiast and/or
electronics collector does that mean i have a radio station? Does that
mean my house is open for inspection? It does not.

A radio station is one that transmitts and/or is licensed (amateur) or
unlicensed (CB). One of these factors has to be known to the FCC
before they can enter a premiss.

Jay,
I don't plan on writing a dissertation for every problem some guy has here, nor should you. The question simply implied that when he keyed up, that the voltage would drop and stay there, and he was wondering if a large capacitor would help, which in this case, it would not. He needs perhaps a serious battery or other source of juice, but a capacitor wouldn't get it. Try not to attack personalities. If you claim to be here to be helpful, then be helpful. Otherwise, like other trolls, leave for more furtile grounds.

>Cheers.... Bob

I think the reason you are asking this question is because of the undulating terrain. Under extreme undulating terrain the higher gain (more focused) antenna might undulate to a point that the signal pattern drops out from the repeater. The lower gain (more broadly aimed) antenna will not drop out as easily.

Under steady state antenna conditions you only get 3db gain. That's not much. If you are close to dropping out of the repeater with the 6db antenna then you are just about equally as close to dropping out with the 9db antenna. Start undulating these antennas just a little bit and the 9db antenna looses the small bit of gain it once had. I would say if you are concerned with undulating terrain then stick with the 6db antenna.

Ah think I get what you're sayin' Jay. Let me give it a whirl.

Pencilpusher. First off, when it comes to CB, "bigger is better" and "more is more" and the goal is to make folks howl with pain and say "Mercy Me, that is the (biggest,loudest, dirtiest, etc.) I ever seen".

So, you want the amp to draw a lot of current. That is a sign of macho-tility. Therefore your capacitors (think of them as the "cajones" of the amp) must be necessity be big, too.

And by all means get a bigger alternator, a heavy duty battery (or a separate battery) and puh-leeze fatten up the wiring. Thick wiring is akin to chest hair, so don't skimp here, or you could be seen as a limp-wristed wuss.

Now with this thicker wiring and revised alternator, you may need a bigger engine to drive all this. Fact, is, maybe you wanna get a bigger vehicle altogether. Like a Mack Truck or a Kenworth.

The FCC can easily figure out if your transmitting from a dwelling.
If you deny that you are transmitting, then the FCC can arrive at your
door with a search warrant and the sheriff. If it actually came down
to that, then you must have some kind of really weird reason that you
don't want the FCC to know you have a transmitter.

A really really short roger beep doesn't sound to bad. And on a noisy
signal can help in the communication. However, when the band is dead
silent, there is no need to use one.

Scary, but I have to agree with Tnom. The rigidity of the antenna and
how/where it is placed on the vehicle will determine its efficiency. I
would suggest that you experiment with both at different times of the
day to see if there is a substantial difference.

You could simply bring the equipment outside for the FCC to inspect. But if they say they would like to inspect your station, i.e. desk, chair, electrical outlets etc., and you refuse, they can't come in without a search warrant. If you let them in, and while going to your station they happen to see a bag of pot on the table, then your busted because it was in plain view and you voluntarily let them in the house.

I would suggest that if your the type who has illegal items in your house, then you should not transmit on any frequency, including a cordless phone.

This is incorrect. You did not give up your civil rights that the constitution gaurentees you. You have just agreed to have legal action taken against you if need be, i.e. fines, search warrants, surveillence, etc.

>Just like in most States when you get your Drivers License, you are agreeing to
>take a test to determine your blood alcohol level (BAL) if you are
>stopped/arrested for DUI. You have given up your right to require the Police

This is also incorrect. You can refuse to take a BAL any time your pulled over. The consequence of this is that you will lose your license for an extended period of time.

I don't know for sure, but here's my guess. If there was a pound of dope on your kitchen table as they walked by to get to your radio, and one of the agents recognized it, they would likely finish their business with you and then pass on a tip to a local law enforcement agency (In the course of their duties they observed the following, etc). Most judges would grant a warrant so that the local law enforcement agency could follow up.

I believe he is talking about a different device altogether. He's talking about the type of device that kills the stereo audio when the squelch is broken on the CB and the CB audio then takes over. I've used one of these and they are very nice to have when driving. Theres no need to fiddle with volume knobs. However, that was on a custom van which had it installed at the factory and I have never tried to install one myself.

No, I think not. The FCC were there on the premise of inspecting your radio station only. If they were there to look for drugs, they would have to say so before you let them in, in other words you agreeing to let them look for drugs. If you were stopped by a cop for something, and he told you he was going to frisk you or "pat you down", the premise of this search is to look for weapons. If in the course of this "frisk", he found a joint, he couldn't do anything about it on the premise of this search because he wasn't looking for "a joint", he was looking for a weapon. If on the other hand, he told you to empty your pockets and you complied and removed a joint, your busted. The law is very specific on these things.

Yes, that is what would most likely happen.  But short of the obvious
hypothetical situation above, granting the FCC access to inspect you
station is just that.  The station only, nothing else.

Actually, what I ment and probably did not explain properly is that the SWR will be different along all points on the coax length. The reading will only be accurate at multiples of the 1/2 wave length point. At the 1/2 wave length point away from the the antenna feed point the SWR reading will be as accurate as your meter will allow. It will reflect the actually SWR at the antenna feed point. Hope that clears it up.

Right, my response was based on output and input impedeance being 50 ohms. If
not,
you will need to match with coax.

Very similar. The HR2600 is the later model, with a very few upgrades,
like some AGC adjustments. Both are fantastic, but I love my 2600 over
my 2510.

Remember these mobile antennas that were made by Turner in Cedar Rapids , Iowa ? They were called Signal Kicker if you liked them or need some parts for one collecting dust let me know. I bought a box of NOS parts I have all types of mounts,base loads,stainless whips,springs and some of those fancy top loads that look like a smashed turd with Signal Kicker printed on them. Let me know if you need parts or want to make an antenna,

There are 13 states in the US that make it illegal to use a scanner in one way or another. It is perfectly legal to posses a scanner, in your house or in your car in the rest of the 37 states. A few of them make possession of a scanner straight up illegal unless you meet certian criteria, like you're a ham, a member of the press, etc. In NY, it is illegal to posses a scanner without a permit. Several states make it illegal to have a scanner only if it's in conjunction with a crime (such as breaking into a store at night, and you have scanner with you, listening for the police to be dispatched). Check out the web page in the previous post and check your state out.

police use a lot of different freq.'s depends on the location. you should
get a scanner and look up your local police freq.'s

It really isn't that stupid--it's the one you don't ask that is stupid!
Just off the top, it would depend upon the frequencies used by your
local police, but generally they are using the stuff above 800 MHz, and
local NOAA information generally is transmitted in the 160 MHz range. If
the radio is crystal controlled on these frequencies, it might be
possible to change them out, but I suspect it would be fairly expensive
for the parts and you would spend a lot of time to get there. Why not
get a general coverage scanner that covers the right range?

ok i just checked and found our police frequencie for the town i live in (which is the one that i'd want in the radio, i don't care about other areas because i mainly use the radio around this county and the freq. is county wide.. anyway, the freq. is 154.800.. would my antenna be capable of that? i do have some extra crystals around here from the old time scanners if that is what the radio would take, but i'm unsure of that.. without cracking it open and i really don't want to do that..

What a riot! My ham shack is a 10th-floor ocean-front condo, with a
view of the Ala Wai Harbor, Ala Moana Beach, and Mamala Bay all the way
out to Barber's Point. My "window" is a sliding glass door taking up an
entire side of the condo, which remains open all day, all year (except
during high winds / hurricanes). My sailboat is docked in the harbor
in my "back yard."

If you're ever able affort a trip to Hawaii, email me -- I'll invite you
up for a beer. The view from the "shack" is truly beautiful. (If you send
me your postal address, I'll mail you a photo.)

As for watching bikini-clad girls on the beach, I'm have my own bikini-clad girl to watch! ;) She's an Asian beauty who's lot prettier and trimmer than the fat-chicks you export over to here from your side of the Pacific.

Now, what's your real beef with me posting CB'er NAL notices to rec.radio.cb? Attempting to anonymously ridicule the messenger just because the message scares you is pathetic and cowardly. I'll now make sure you're the first to know each and every time a CB'er is fined for illegal on-the-air behavior.

Jeff KH6O

P.S. I've already been to the beach this morning: I'm in the 80+ degree water every day at 6am for a 2 km swim. If you ever make it over here, I'll be happy to race you -- winner buys lunch. Be forewarned, though -- I broke three state swimming records a decade ago. I'll show you the medals if you have any doubts.

I am looking for a TRC-458 Navaho that has never been modified. I want one in stock condition. I want one with good cosmetics (like at least an 8 out of 10). If anyone has or knows someone that has a 458 like I described that they are willing to sell please Email me . All replies and correspondences are greatly appreciated.

Correct. If the antenna impedance is not the same as the feedline, the SWR will vary along the length of the coax. One can easily be fooled into thinking a good SWR has been acheived when in reality if the SWR bridge is moved a fraction of a wavlength in either direction the SWR will be different. Care as to where the SWR bridge is placed is important. Ideally is is best to check SWR at the antenna feed point.

Regards
James

First of all, peaking the output power won't make any difference in how much further away you can hear people, it will affect how much further away people can hear you. Second of all, using this radio is a violation of FCC regulations and you are subject to fines and confiscation of your illegal radio equipment, particularly if you are causing interference with other devices, which you most probably are. Third of all, rather than run illegal power, if you really want to get out, invest in a decent antenna. Those truckstop specials generally are designed to provide a "close enough" match to the transmitter, but generally don't provide any gain and waste more energy in matching to the transmitter than they actually radiate out of the system.

I happen to be a licensed Advanced class Ham operator. I also happen to be the owner of at least 4 CB radios. I became a CB operator back in the summer of 1977 with the call sign KAXN-9546, which expired LONG ago. I even still have my first CB, although it's not still in one piece and requires a little work on the audio output section to be functioning again, a little "Smokey" 23 channel unit. All my CB units are clean, legal, and type-approved, just the way they should be, and have been that way ever since I began operating. I have never, in the past 22 years seen the need for me to run illegal equipment. When looking at radios to buy, if I see that they've been modified I walk away. I am not interested in "soiled goods."

My ham equipment is the same way, unmodified, and operating according to original manufacturers design specifications for output power, spurious emmissions and the whole nine yards. That kind of operating is called "courteous" folks. That concept is something that most of the CB operators around here have yet to understand. Hell, I have a license to modify my ham equipment. I also have neighbors who enjoy watching TV and talking on the phone. Guess what. My urge to experiment takes a back seat to my neighbor's right to view television programming or converse with friends and family.

Too bad there are so many "good buddies" who don't understand that their "right" to break the law interferes on the real rights of others to utilize the phone, the stereo, the television, etc. Then again, maybe they just don't care.

In Brooklyn, Ohio; it is against the law unless it is an emergency.
They just recently passed this law

Go to:

http://www.rebateco.com

and check out the GE 40 channel transceiver. Don't know if it's a good radio
or not, but you can't beat the price after rebate and S&H -- $3.99. Looks like
it comes with everything you need.
On a related subject, I've been looking into getting a couple new antennas for
my handhelds (the ones that come with the HHs aren't usually that great) and
based on what I've read in this newsgroup, the Cherokee SA-4s are pretty good.
Hope it helps.

Russ

John: The SWR on a transmission line does not vary along the length of that line.
The value you will read on a typical meter MAY vary, depending on where in the line the meter is placed. Again, the SWR does not change, it is the same at ANY point on the line. A 1/4 wave section has the property of inverting the impedance at the other end, while a 1/2 wave section will repeat the impedance value seen at the other end.
The line loss will cause the SWR to show as less than the actual figure. SWR measurement is uncertain at best because of the small amount of reflected power when the mismatch is below 1.5:1. A reading less than 1.5:1 may be off by 25% or more, so don't take low numbers as exact!
One of the problems seen when measuring an antenna's SWR from the transmitter end is RF flowing on the outside of the coax. This will cause erronous readings, and must be corrected by a choke at the antenna end of the coax. Antron 99 antennas are especially bad in this regard.
The ARRL has some accurate, easy to read books on antennas. If you are into building stuff, there are nice construction projects that will fit right in with CB radio!!

he, he, he, ROTLLMAO. Jeff, its sounds an awful lot like you love to give yourself warm and fuzzy feelings, but believe me, the rest of the planet doesn't really give a rats ass. Perhaps you and that other symbol of amateur radiodom, The DonkeyBoy, should swap stories in order to see who has the best yarn. As far as NAL's are concerned, save yourself the effort because believe it or not, we CBers know how to access the FCC website just like you. You see, I just freed up some more swimming time for you.

Oh, and by the way, This posting was submitted from alt.radio.cb.

I would like to tweek my Cobra 20 Plus a bit. I believe I have tuned my antenae properly, but would like to have at least the legal max in power. Approx. 2.3 watts now. I have a list of coils to try, but I am not sure how to supply my radio with a dummy load. Any info would be greatly appreciated.

This is also my first newsgroup and I am not sure of protocal so I will leave my E-mail address so please by kind.

Actually, Gary, you and Mr. Lucas are correct but then not totally correct. First of all, on paper, CAPs usually provide for initial current draw and sustain for a period of time until it reaches its load capacity (voltage drop). Then the charging system feeds the CAPs and (depending on what farad capacity the CAP holds) the CAPs voltage steadies. Now, when hooked up to a keying-type amplifier, it does the same thing. Although the intial surge of amperage draw is "helluvalot" more than a commercial audio system, (if the vehicle is running) the mobiles charging system will kick in and sustain the CAP and battery's charge. Speaking through experience, CAPs is an excellent idea for surplus amperage/voltage storage. In all intents and purposes, it is a battery but doesn't hold any reserve amperage.

Why would hi-performance mobile stereo owners put CAPs in-line with their amplifiers and batteries if they knew it would drain and not hold any voltage/amperage to sufficiently run their stereo system? Usually, sound systems are played for hours on end. You rarely see any stereo system fanatic turning off their stereo just to charge up the CAPs and/or batteries.

Just my 2 Abes...
Ipo Camacho

I bet you are probably right, although it will be tough to get many hams
to admit to having 27 MHZ roots.

For some strange reason=A0=A0=A0=A0-=A0=A0and I am guilty of this
too=A0=A0-=A0=A0=A0=A0many hams are ashamed to admit that they got their
start in CB.

Although I got my Novice ticket in 1993 and quickly upgraded to Extra
Class, I find that I used to have much more 'FUN' as a "free bander!"

I am currently running a D104 Silver Eagle on SSB. To get quality audio, I just turn down the mic gain on my radio to 1/4 way. Would a sideband mic like the D104 with a 10-DAL head produce better sideband audio than what I have now? People say I have 10-8 audio on sideband with the mic gain turned down.

Exactly Jeff,
Up until about 1980 you had to be at least a General for a year to even test for Extra. I doubt that PUSSYCat is old enough to remember what happened in 1983 much less 1963.

I've known that PUSSYCat is a liar for months now. He makes antennas out of pine trees, he makes grounds out of magnets. Who does he think he is? MacGyver?

I'll bet your monitor has more than Wildcat cooties on it. Be careful! He'll threaten to call your employer, your ISP and even your mommy if you aren't nice to him! He's even less than a PUSSYCat.

Kevin, WB5RUE

In the 1960's they took prayer and the Ten Commandments out of our public schools hoping to liberate a generation. They succeeded. Now we have a generation who thinks they have the liberty to lie, cheat, steal, kill, freeband....

Those are both nice pieces. I have the Johnson, but I'm still looking for a
nice SSB-50. If you want to sell it, let me know.
The power supply thingy for the Johnson is very cool, I have that too. It's
got serious output too. That should be a bit of a collector combo there,
the Johnson with the PS.

Dollar value? I'm no expert. I bought the Johnson PS for $20. I bought the
Johnson 352 broke for $20.
I see SSB-50s going for about $40.

Do the fold over and quick disconnect's out there make a good connection
when compared to not using one- espically when 400 watts are considered?
Thanks.

This seems in the ball park. Especially if you don't have any swing coming
out of the radio itself. Could run alittle higher out of the radio but you
might over modulate. The best thing to do is to get the most swing out of
your radio and it should boost it up alittle. But don't expect too much
more.
Tinker

Not necessarily... the presence or absence of an antenna does not mean a radio is being run there. I first got interested in having a base station when I moved into a house that had a beam antenna on top of a tower that was left behind when the previous owner passed away. The radio itself was taken by one of his kids and the antenna was simply left. Now, does the presence of an antenna give the fcc the right to demand entry into that house without a warrant?

To finish the story, one of the neighbors had an antenna concealed in his attic. He was running power and totally screwing up all of the TV's in the neighborhood. Someone called the FCC and because they could see the antenna (hanging in tatters I might add from years of neglect) they came to my parents door and demanded entry. At that time the only CB any of us owned was the barefooted Cobra in my Dads truck which was parked at his dispatch yard nearly 30 miles away.

This was back in the late 70's when the FCC's gestapo tatics were even more common than they are today.

Hi All,

I'm looking into buying a new mobile radio for my RAM.

Is the new BEARCAT GRANT LT CB any/ much better than the GRANT XL?

Do appreciate the info.

I had a thru-the-glass antenna for a while. Don't know what type it was, but I picked it up at Radio Shack. Worked OK for receive, but the transmit range was pretty poor. I finally took the big step and drilled through the roof and put in a Wilson 5000 in and that was like the difference between night and day.

That is quite astounding since you had to take the Novice test by mail,
and the General at an FCC office, which was not open on week-ends, and
there was no Advanced class in 1963.

Yep, there is a lot if cb type activity on the ham bands.

Hams are allowed to have scanners under fed law I think, You just have to show
them your licence. If you have any probs, then you can gotto a lawyer

At 14 volts and the a current drain of 60 amps, the load tothe battery appears as a .23 Ohm resistor. The size of the cap is not a consideration here. If you wanted a time constant sufficient enough, at that current drain, to filter peak IR drops from the power lines you will need to have a capacitance of at least 10 to 20 Farads. Since the load appears so small, any IR loss in the power cables to the amp will be magnified emensely. If you are not running at least #8 guage wire, no cap will help. To give you an example, If the resistance of the wire is ,25 Ohms, you will have only half the battery voltage across the amp. ANother problem also encountered is the internal resistance of the battery. In lead acid batteries that are fully charged this is about .1 Ohms. This rises to about .5 or more when nearly discharged.

Before you invest in buying a BFC, (Big Frigging Cap) I would increase the guage of the wire supplying the amp to as large as you can fit in the vehicle. Secondly I would wire the amp directly to the main distribution off the alternator. Thirdly I would verify that the alternator can handle the excess current. If after all these are met, then only would I consider a BFC. The BFC' sare only usefulll in handling peak current loads. They help to smooth out the peak ripples that occur on peak demands. The BFC is not a voltage source. It only stores a small amount of energy as compared to a battery. It is used expecially in audio systems to supply enough energy during the peaks of the audio signal in large systems. The same can also be applied to radio. On very large peak demands will the cap supply energy to replace that which is lost in the resistance of the wires feeding the amp. Once the energy is used up in the cap, it needs to be recharged. The only way it can be recharged is to reduce the peak current drains.

As for the value and voltage rating of the BFC. For a mobile application and large peak current applications, larger is better. The problem is that larger is more exspensive. For the voltage rating of the BFC, 20 VDC is a minimum. If your regulater fails the voltage out of the alternator can reach 18 to 24 VDC. I would hate to see a cap of 2 farads explode. Also with caps that big make sure the terminals are not exposed. A short across those will really cause a spark. Arch welding type sparks. To give you an example, I left pits on a srewdriver from a .1 Farad cap charged to 12 VDC when I discharged it. A 2 Farad cap will diffinetly arch big time.

James

Receive would be no problem. Your CB antenna is much longer than necessary but that just means you are at multiples of the wave length of the 154.8MHz frequency.

Hey Gang!!!
Finally went through entire box of tubes purchased at an estate sale WHEW!!!!
Gonna compile a list for email for those interested. some in boxes some wrapped
in tissue. opened all to insure that what the box or paper say's jives.
Tubes will be priced from $2.00 to to $45.00.
Here are a few on the list! will have list ready for email Monday am. 73

(9) 807 $9ea
(1) 6146 $12
(2) 6JB6 $22 ea
(1) 6KD6 $45
(1) 42 $17
(1) D32 $19
(1) 76 $12
(2) 6HF5 $14ea
(1) 6F5G $12
(3) 12BY7A $8ea
(2) 12AT7 $6ea

(4) 12BEG $4ea
(3) 5V4GA $11ea
(2) 6V6GT $9ea

Oh, now I see that I've been exchanging posts with a pathological liar.
Even as late as 1976, when I got licensed, one had to go to an FCC office
to upgrade from Novice to General. Monday through Friday, only -- government offices were closed on Saturdays. There was no VE testing system as
we have today (and one had to wait about three months for the license
to arrive by mail). In 1963, I believe one had to have been licensed for
at least one year prior to being allowed to take the Extra Class exam.

Yuck, my monitor has "wildcat" cooties on it -- better disinfect it.

You can do whatever you want, but you might want to check on the
www.fcc.gov page under enforcement.

The FCC says they do NOT NEED a warrant to inspect equipment during
hte hours it is being operated.

The MAXIUM FINE is usually assessed against those who refuse entry to
the FCC people. Most of the time they assess $7,000.00.

Make your own decision, but I'm going to let them in if they come to
my door!

There are different grades of stainless steel, and some manufacturers
have better production and quality control standards than others.
Although I haven't compared all the SS whips side by side I wouldn't
dismiss the possibility that some are better made than others.  I do
know that Radio Shack's product standards are not always top of the
line, they try to keep prices down by going middle of the road.

IF the charging system (or power supply) could react quickly enough to recharge that LARGE capacitor, then there would be no need for the capacitor!!! Sure the cap will aid in supplying current on peaks, IF the peaks are far enough apart that the cap can regain it's charge. Run some numbers with current draw, voltages, cap sizes, and time constants to see how little help the caps really are.

Second point is that most mobile stereo owners are NOT very high performance!!!
They are usually brain-dead from the intense pain cause by the excessive sound levels in their vehicles. So they often buy stuff for their system(s) based on some other clod's advice. Anyway, a bank of pretty caps, wired neatly, mounted in a nice pattern, does look great, and has made some money for the seller. The buyer also has had to work at his job long enough to buy the caps, so I guess everyone's ahead......my money goes for better antennas and such.

This is very interesting because the State of Massachusetts is currently debating a similar law. The MA law would limit cellphone use to "hands free" operation which would mean that a cradle for the handheld cellphone would have to be installed in the vehicle. When I heard the details of this proposed legislation the first thing that came to my mind is "How does one call another without any type of VOX system?"

One would still need at least one finger on a number memory button to activate the cellphone.

You're absolutely right Jeff, someday with a quality education I'll actually be able to hang up my McDonalds hat forever. That French Fry oil was really getting to my brain. Thanks for the tip.

> I'm really flattered that you think it's a yarn, but it's all easy to

> -- our economy needs it.

You might want to put that quality education of yours to work and find out the real definition of a yarn. I suggest you use Funk and Wagnalls as compared to Websters Unabridged.

> But now that I know it bothers you, I'll be sure to post the NALs.

Ha! Its not the NAL's that bother me, mostly because the NAL's are being handed out to more amateurs than CBer's. Its the fact that some pompus, self righteous, and sadly confused individuals think that because they passed a test that a 12 years old girl just passed, they are self ordained radio cops. It is actually pretty pathetic. In addition, SOME of these same guys feel the task is theirs, to enlighten the uneducated (or under-educated) radio enthusiast because THEY supposedly know more. You seem to be the quintessential poster boy for this group.

> I'm done with these exchanges; they serve no useful purpose. Give me a

Why use a cap if it does not hold any reserve amperage?

The reason the caps help the audio guys more than the CBers is because
of the peak loads during heavy bass output. You know those that shake
windows and such. The cap stores excess energy for these kicks, and
usually have time to recharge before the next quake. I have buddies who
enjoy the car audio hobby and the caps do work.

>SSB-50. If you want to sell it, let me know.

Thanks for the response. I'll be holding onto the radios for a while.
Haven't had the opportunity to test the SSB-50 for functionality yet.
I'm sure it works though, the guy said they both worked, and I do know
the Johnson does.

>Dollar value? I'm no expert. I bought the
>Johnson PS for $20. I bought the Johnson 352
>broke for $20.
>I see SSB-50s going for about $40.

Well, I guess I got a good deal then. Paid $10 for the SSB-50, and $12
for both the Johnson and the supply. Considering the condition they are
in, I'm happy I picked them up.

A question: Is there supposed to be a plastic window over the channel
display on the Johnson? It looks to me like there should have been, as
there isn't one on the unit I picked up. Doesn't seem natural to leave
the display "open" like that.

Thanks again,
Power House

David, have you tried the opposite, set the radio mic gain at 75% and
adjust the D104 down until you get strong but clean audio on SSB.

Sorry , I have never used any of the voice compression or SSB mics. I
have operated on SSB for about 10 years and the method above worked
well on my Grant.

Some basic SSB info:

The person that took this test was my brother and the testing was given at The Customs House in Boston, MA (which is where the FCC office was/is? located). I never said it was I who took the test because I sat for the General Exam in 1975 at the same location, and I hate to break your heart, but it was on a Saturday. As far as the Advanced Class is concerned, I am not an active amateur, nor was I ever really one, so I do not know the structure and the dates of the amateur licensing system. I was under the impression that he was an Advanced class ticket holder however he did take all of the appropriate tests in one (1) day.

I do not think that the cap will be much help on a CB amp, but the SSB operation application is interesting. I wonder how large the cap would have to be in order to be effective. I bet you could get an alternator upgrade and a bettery for the same cost.

I have never used a cap for a mobile CB amp, and I suspect that it is not worth the effort.

In my opinion large RF amps are not necessary. RF energy is serious business. I don't want to be beside someone transmitting 1000 Watts of RF power anymore than I want to be beside someone who took out the spare tire and replaced it with three 12� subs.

Pathological Liar, yup thats me Jeff, whatever still gives you that warm and fuzzy "superiority" feeling. It probably comes from that lack of a quality education. This is usually what happens when I comment on things that I am not "completely" familiar with, similar to the Hams who spend a considerable

amount of time on the CB newsgroups touting rules/regulations and
Constitutional Law that they aren't completely familiar with. An arrogant
smart-ass perhaps, but a liar I'm not, Im called too many other things and I
cant take on any new titles.

Sounds like you're a tad bitter about my previous post.................a
good swim will work it off.

Well I hate to break your heart, but you could ONLY take the Novice test
by mail, even in 1975. I quote directly from a 1975 ARRL License Manual,
"The Novice Class license examination may now be taken only by mail."
They did not give Novice tests at the FCC office, so he must have
already held a Novice license. So I suspect he only upgraded to General,
and he would have had to held a General Class license for two years
before being eligable to upgrade to Extra. So he could not have gone
from General to Extra in two weeks.

> Well I hate to break your heart, but you could ONLY take the Novice test by mail, even in 1975. I quote directly from a 1975 ARRL License Manual, "The Novice Class license examination may now be taken only by mail." They did not give Novice tests at the FCC office, so he must have already held a Novice license. So I suspect he only upgraded to General, and he would have had to held a General Class license for two years before being eligable to upgrade to Extra. So he could not have gone from General to Extra in two weeks.

Perhaps you are correct JJ and dont worry, my heart isn't breaking. Unfortunately my brother is no longer accessible to verify the information I posted however I differ with you about the Novice Exam. I personally took the Novice Exam in 1974ish and this was done in person. This fact I am willing to bet the farm on. The person who posted that the license took 3 months to get back from the FCC is probably correct as well because I remember that it did take some time to get the ticket back, however I thought it was closer to about 6-7 weeks.

Hi John,

This is strictly hearsay, but I gather that the replacement to the Grant
XL doesn't compare favourably with it's older brother. I have the Grant
XL myself and find it works better than any mobile CB I've every used or
owned. I think it's a safe buy if you can find one.

Cheers!
Andy

What you need is a 50 Ohm, non-inductive power resistor. In this case,
20W would be the best. They can be tricky to find, but do exist.

If this unit is a 4Watt mobile, you can cheat by using a #47 light bulb
soldered to a PL259 connector. This way you can determine by the
brightness of the light just how much output you have.

Cheers!
Andy

IF the charging system (or power supply) could react quickly enough to recharge that LARGE capacitor, then there would be no need for the capacitor!!! Sure the cap will aid in supplying current on peaks, IF the peaks are far enough apart that the cap can regain it's charge. Run some numbers with current draw, voltages, cap sizes, and time constants to see how little help the caps really are.
<<<<<<<<<<<<<<<<<<<<<<<>>>>>>>>>>>>>>
the biggest thing that the caps will do will be to ease the jolts on the diodes and the stator in the alternator by more evenly pulling on it as well as more evenly distribute the juice to the system. In other words the caps will maximize the flow while evening it out. Less hard hits and more smooth ones. If you're trying to get more than the alternator will provide you will be replacing it soon, so just buy another or so now and mount it in advance.

I bought a brand new Cobra 18WXST cb and it blows fuses immediatly after plugging in the cigarette lighter plug. I checked the polarity in the wires for the plug and they are correct.

I then disconnected the plug and just took the 2 wires on the CB and
connected them straight to the battery, the positive cb wire has an
inline fuse which blows up immediately.

I don't even have the cb powered on in any of the situations above.

Is this cb junk? Is there something else I'm missing? Wiring a cb with
2 wires into a cigarrette plug adapter seems pretty straight-forward.

I'm beginning to think my 'new' cb is someone else's returned cb. If
someone had hooked it up incorrectly, wouldn't the fuses protect the
cb? How can it be checked?

thanks for your suggestions,
mark

The licensing process has only become quick in the last couple years, since the FCC went to a more automated system of issuing licenses. The last license transaction I had under the old system was in 1993, and at the time it took over 2 months to get the license back in the mail. Now the license is assumed issued when it appears in the data base, so if you take a test tonight, the vec gets the information tomorrow or the next day, checks it and then sends it on the the FCC, and within a day or two, the license is issued. Quick.

I AGREE WITH ANYONE WHO DOESN'T LIKE THE FCC COMMING INTO YOUR HOUSE TO INSPECT YOUR STATION WITHOUT A SEARCH WARRANT BUT THE SAD TRUTH IS THAT BY OPERATING A CB RADIO, YOU ARE AUTOMATICALLY LICENCED TO DO SO.
THE TERMS OF THAT LICENCE SAYS THEY CAN DO IT!!!
THE CONGRESS OF THE U.S.A. IS A LAW MAKING BODY SUBJECT TO THE VOTERS OF THE UNITED STATES.
THE FCC IS A RULE MAKING BODY SUBJECT TO NO ONE BUT CONGRESS.
THE FCC CAN CHANGE THE RULES IN THE MIDDLE OF THE GAME MOSTLY WITHOUT CONSULTING ANYONE.
ELECTED GOVT. OFFICALS MAKE LAWS THAT, IF BROKEN, CARRY PENALTYS.
THE FCC MAKE <RULES> THAT, IF BROKEN, CARRY FORFITURES.
I'VE NOT SEEN ANY OTHER COMMITTE OR COMMISION ANYWHERE IN GOVERNMENT THAT CAN MAKE RULES,AND A RULE THAT THEY CAN COME INTO YOUR HOUSE AND INSPECT/ CONFISCATE YOUR PROPERTY,ISSUE YOU A NOTICE OF APPARENT LIABILITY IF YOU DO NOT SUBMIT ALL WITHOUT A WARRANT.THEN ASSUME THAT YOU ARE GUILTY AND MAKE YOU PROVE YOUR INNOCENCE EXCEPT MAYBE THE I.R.S.
THEY ARY VERY CAREFULL NOT TO CALL RULES, LAWS AND FORFITURES, FINES.

AND ALL THIS IS ON EVIDENCE PROVIDED USUALLY BY DIGRUNTLED HAMS WHO PROTECT THEIR WIDE SWATH OF SPECTRUM LIKE THEY OWNED IT AND WERE LICENCED TO USE IT BY THE ARRL.
I AGREE THERE IS NEED FOR SOME SORT OF CONTROL BUT THE RULES ARE ANTIQUATED IN LIGHT OF ADVANCES IN TECHNOLOGY LIKE BETTER RECIEVER ADJ. CHANNEL REJECTION AND THE 125 MILE GROUND WAVE RULE NEEDS TO GO. AND DON'T EVEN GET ME STARTED ON THAT BAD JOKE OF A CODE OR WE'LL BE HERE ALL DAY.
JUST SOME THOUGHTS.

JEFF

You lost me.

Why does applying a voltage to the tin can create magnetism on the piece
of steel inside?

What do you mean by "electromagnetic degradation"?

Why would a coax in a car experience any "electromagnetic degradation"?
Would not any effects from a magnetic field on a coax be cancelled out
due to the fact that the coax contains two conductors which carry currents
in opposite directions? Isn't the differential voltage (or current) the
same regardless of the effects of a magnetic field?

The whip itself might be the same material--maybe even from the same subcontractor, but the base is really what you are paying for, and how it attaches to the actual whip. Take a look at the construction of the base.

I have a SSB uniden chassis similar to the Cobra 142GTL.
I put a 4.7uh choke in series with the varactor diode to give me more slide. Well it did. The problem is I can't align the pll with the clarifier in center position. To be on frequency the clarifier is almost full clockwise. It will slide a full 10KHz but I want the clarifier to be centered when on channel. It seems ct3 does not have enough range but I added and subtracted capacitance, and still nothing works. I even added the same amount of inductance to ct3 and that did not help. Am I missing something here? Surely this can be done. The alignment step is the 34.9875MHz adjustment on channel 19 in USB. CT3 will not go above 34.9842 with the clarifier centered. Anybody done this before?
Larry

You are right about the loose joint at the chipswitch. I thought I had a bad display until I came up 81N through PA and the bumpy roads knocked the chip most of the way out. Upon inspection I realized that it had come out of the socket. I put it back in and all is well except that now I have to push the band button at least once before the radio will rx/tx. All I did was push the chip back down and seat it well in the socket. I had to bend a couple of the legs a little to get good contact. Also you may want to consider having the socket removed and having the chip soldered directly into the board. It may solve your problem permanently.

By the way this was the first time the radio was mobile, as I was using it for a base for 2 years. I bought it new in the box and had the chipswitch installed by "half-breed" in the Binghamton, NY CB shop. This was a great talking radio until this incident. I have never had to take the covers off of it until this and when I did I discovered burned wires, plastic components, and poor soldering. I think a blind monkey with no fingers could have done a better job. Please be careful, as I thought I had a decent setup until I really looked closely and avoid that shop like the plague.

Robert,

I think the suggested retail price of the CBS-2100 will be around
$495.00. If I were going to put a price on the CBS-2100 at this time I
believe it would be around $260.00. And of course we will meet and beat
any competitive pricing.

Thanks for your interest in Palco Electronics,

Tony

Hi Robert,

Really nothing to it. Order the Wilson W-1000 Magmount. When you order specify that you want the Wilson SLA antenna in place of the 62" whip that normally comes with it. The cost of the SLA antenna over the 62" stinger is $3.00 more. Put your Antenna on the roof, run and route the coax already attached to your mag base to your radio, install your antenna (62" or SLA), set your SWR and you are in business. If you decide you want the 62" whip as well as the SLA antenna, the price of the SLA antenna will be $11.99. And of course as usual we will meet or beat the competition.

Thanks for thinking Palco Electronics,

Tony

Guess thats the reason when you walk through an auto parts store, you
see that all the battries are all stuck together. All that voltage on
the posts creating all that magnetism. Make almost as much sense as
we have lightning strikes because of magnetism attraction.

Some do and with others it depends on the size of the antenna.I use the
type available at truck stops and put a hoseclamp with a wingnut at the

very bottom to keep the QD from spreading but I do run big antennas 150
miles a day on rough roads.

I recieved this via email 1 week ago with instructions to post this so
it cannot be traced.
I had forgot to post this then so here it is, am an now doing this while
on vacation.
Stan VE3PET

RADIO HAMS SEE THE TRUTH
It is finally here�. After months spent enduring the garbage which has been spewed forth by the members of the JOKER AMATEUR RADIO CLUB, THE NOMOJO AMATEUR RADIO CLUB, and the even more disgusting GROUP OF CERTAIN NAZI HAMS THAT FREQUENT THE 146.94 AND 147.045 REPEATERS, AND THE 147.57 SIMPLEX FREQUENCY and their band of mealy mouthed, back stabbing, two faced lying malcontent faggots, decent law abiding amateur radio operators in Palm Beach County have begun to take back their clubs and airwaves.
Fed up with the lies and innuendo, which have caused considerable

division amongst local ham radio operators and Palm Beach County Government. A cohesive effort to thwart the efforts of this virulent minority has come forward to stem the tide, which is poisoning our hobby and causing the PALM BEACH COUNTY government to realize that some of their employees are thieves, druggies and liars

Recent elections in the West Pal Beach Amateur Radio Club sent a clear message to these STORM TROOPERS of �THE FUHRER� W4SS, MANNY PAPANDREAS that their brand of amateur radio guerilla politics and HITLER TYPE PRACTICES are welcome in Palm Beach.

The actions of �THE FUHRER� W4SS MANNY PAPANDREAS, AND STORM TROOPERS KG4U GRAF T. FUCKENMAIER WD4IUD, WALTER PEACE, AD4PS, DENNIS HAMILTON, W2TIA LEO WINTER, W1OB, JAMES DOVER AND K4LES LESLIE FAGGOT CARTE have caused the cessation of all traffic nets in the West Palm Beach Area. Some of these individuals have done serious damage to the long running West Palm Beach Test sessions.

Even Federal governmental agencies are wondering �WHAT GOING ON IN PALM BEACH COUNTY�. They look at Frank Haggerman and have him on their list. FRANK FOR SOME REASON CANNOT FIGURE WHY THE SECRET SERVICE visited his HORSEBARN THAT HE CALLS HOME AND QUESTIONED HIM �WHY DID HE MAKE THREATS AGAINST PRESIDENT CLINTON�. But we all know Frank is a good radio ham�HE NOT ONLY MAKE TREATS AGAINST THE PRESIDENT BUT HAS BEEN CAUGHT JAMMMING ON VARIOUS REPEATERS NUMEROUS TIMES. BY THE WAY FRANK HAS THE INTERNAL REVENUE SERVICE SETTLED UP WITH YOU YET?

Keep up the good work Frank, THE FUHRER MANNY W4SS WILL BE PROUD OF YOUR NAZI/HITLER TYPE ACTIONS.

After the ARRL disbanded the test team for violations of FCC Part 97 rules this test team has been able to regroup and continue to operate under new management and a liaison that is honest and will not allow the unethical games played by the previous NAZI test team to continue.
KG4U GRAF T. FUCKENMAIER AND AD4PS ARE NO LONGER allowed in the ARRL VE program. AD4PS DENNIS HAMILTON WAS KICKED OUT OF THE ARRL VE program because of questionable actions during an ARRL test session. Membership is all of the major clubs and repeater groups in the area have suffered tremendously along with repeater traffic dropping to an all time low. Several hams that are currently under the employ of Palm Beach County Government and local municipalities have been the targets of investigations as a result of their actions such as thievery, ethnic slurs, threats against civilians and homosexual actions on county time.

PALM BEACH COUNTY government officials have issued a direct order to AD4PS DENNIS HAMILTON, not to use any amateur radio equipment while he is on County time as a result of threats made by him to a County civilian. Believe it or not AD4PS DENNIS HAMILTON is the R.A.C.E.S. officer for PALM BEACH COUNTY. WHAT A DISGRACE TO THE R.A.C.E.S. PROGRAM AND TO PALM BEACH COUNTY. KEEP IN MIND THAT �THE FUHRER� W4SS MANNY PAPANDREAS IS THE HEAD OF THE PALM BEACH COUNTY EMERGENCY MANAGEMENT PROGRAM. This program is now suffering from lack of participation due to the action of the NAZI managers of this much-needed emergency program.

Even the faggot infested Wellington E.O.C. has better participation in emergency programs.
As a result of these actions there has been a resurgence of decent amateur radio operators who have vowed to take up the fight against this insidious cancer which has plagued the hobby here in West Palm Beach. There is currently a loose confederation of hams who have begun to rally around this silent majority and move toward regaining control of ham radio, and sending forth the message that �THE FUHRER� W4SS MANNY PAPANDREAS and his lying band of disgruntled malcontents NAZI STORMTROOPERS don�t speak for the rest of us.

Charlie Newell K2GNZ/?

Yes there is a short somewhere in the circuit, but if it is new, take it back to the store where you bought it and get a new radio.

lol.....My feelings exactly. This is the stereotype that we CBers have endured from many in the Amateur community for many years now. Unfortunately I know many a CBer who eventually became an Amateur, and then looked down upon his radio roots as if embarrassed.

Wasn't it Harry Truman who said: "I will never abandon my friends for the sake of appearance"

I get the feeling I did not properly state my circumstances and equipment setup in the original post. Although the postings thus far have been very helpful. I am running a 100 amp alternator, one auxillery group 24 battery, and 4 awg wire that is reduced to 6 awg at the amps connector (approx 24" prior to the fuse assembly). The voltage drops to approx 11 - 11.5 volts only at the peaks of modulation, but

returns to approx 13+ volts throughout the rest of the transmission. If
there is any interest left in this topic, do you think that a capacitor
would now serve my purpose to sustain voltage. If not, it sounds like a
150 amp alternator is the way to go. Thanks for the help.

if you bought it new, take it back.
if you bought it used, there's a diode near the power wires on the circuit board that is hooked up in REVERSE across the power connections to protect the radio if it is hooked up backwards. it it shorted and needs to be replaced.

yes the 2510 can actually be made to unlock and go very low. these are the only
ten meter only radio that are of good enough qaulity to be full ham radios.
take a look at www.chipswitch.com and it has the info about the wide banding.

I don't want to open the amplifier can of worms here, but you might want to ask yourself just how much power do you need and at what cost. How much farther do you expect to get if you pump another volt into the amplifier? The last time I had to buy an alternator it certainly wasn't cheap. For you this might be a hobby. Heck you might want to get those air shock things on the car as well and make it bounce up and down as you go down the street--I don't know--but dollar wise, it seems non productive. Still don't think a box full of capacitors is going to do much for you, but hell, spend the money and keep someone in a job. Sounds like that is what you want to do anyway.

Increase the size of your alternator since when you keyup and modulate the battery voltage drops below that of the batteries normal 12 volts meaning your alternator and battery are not keepeing up with the demand adding a capacitor will do no good. You could also use a 6 volt and a 8 volt battery in series to give you 14 volts you will need to charge them at 15.8-16 volts, which will give you more watts. Don't worry the rest of the cars electrical system will handle 16 volts easily. What size amp are you using, you may want to turn the deadkey down this way you only draw minimum amps under a deadkey.

I have this Yaesu tuner for sale, 500 watt capability, two meters for Power and SWR, the tuner is in good shape. Some scratches on trim top cover in right corner has a ding, and one of the knobs have a crack(easily replaced). Inside of tuner is spotless.

If interested I would sell for $160.00 or trade for small base amplifier(300 watts) in perfect working condition.

Thanks for reading

Doesn't that particular CB have three wires? Black, Orange, and Red?
Anyway. As Gary wrote, just take it back if its new. If it isn't new, then it almost sounds like the reverse polarity diode is, hmpt, reversed.
Chances are if your cigarette lighter is NOT a center positive, and if this is the route you chose first, then it blew the fuse AND the reverse polarity diode. Either way, STOP TRYING! This would mean that you would need to replace this diode, and use a continuity tester to check continuity between the positive wire on the cigarette lighter plug and its center conductor on the plug itself. If there is continuity, then the wiring of the plug itself is correct. Now, use a multi-meter (volt) to check whether or not the center conductor on the cigarette lighter (where you put the plug) has a positive charge.
Its pretty much standard now with the ever growing use of cigarette lighter

```
plugs to make the center conductor positive, but, better safe than sorry.

Or, if everything is correct, then the CB is junk.  But, check all of this
before junking another one, to save you time and effort.

Hank

The battery has far more "capacity" than what you can add with a few
capacitors. Adding another battery in parallel would do more than
capacitors.

Hey Wildcat
I got my start in CB radio too. Like you I seem to have more fun as a freebander. I got my Novice ticket in 1976. I'm a advanced operator. I saw little Richard on a movie on HBO. As he ran off at the mouth he sounded like one of the clowns on channel six. All I could do is laugh. Don't get me wrong I have had alot of enjoyment out of my ham license.

Sparatic E-skip on 11-meters is still fun to listen to. That north to south skip is always fun to listen to. That crap that comes out of rico sucks.

what relevance does that have to do with anything? ham liscence doesnt matter.
you have to be a well qaulified technician capable of making refinements to the
radio while using the chip to unlock it to go that low. most general hams arent
smart enough for that.

> Then why isn't it called HAM type activity???

You're missing the distinction between CBers who happen to be licensed but continue to behave like CBers, and hams who behave like hams. "Ham-type activity" falls into a ninety-plus-year-old well-defined category (see below for our modern-day government-mandated charter). Operating outside that category places one outside "ham-type activity." For example, the CBer who gets his Advanced ticket but says he misses his illegal free-banding days is certainly on the peripheral edge, walking that fine line that separates him from the established amateur category.

Hope that helps.

Jeff KH6O

97.1 Basis and purpose (of the Amateur Radio Service).
The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:
(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.
(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur's unique ability to enhance

international goodwill.

Depends on the states. Some states do not even allow hams to have 'em, like NYC (without a special permit).

check out http://members.tripod.com/KF4KHC/comm.html

There's a link on there that takes you to a page with a link to state laws regarding scanners.

Gee:

I wonder ehy this lame head idiot posted this message to rec.radio.cb? This is a ham problem and not a CB problem? Furthermore I think I know who th eamatuer that sent the email is and if he really wants to remain unknown I suggest that he no longer sends emails to his freinds. For he is in just as much violatiuon as the idiots he complaining about.

*
*RADIO HAMS SEE THE TRUTH
*It is finally here�. After months spent enduring the garbage which has
* been spewed forth by the members of the JOKER AMATEUR RADIO CLUB, THE
*NOMOJO AMATEUR RADIO CLUB, and the even more disgusting GROUP OF CERTAIN
*NAZI HAMS THAT FREQUENT THE 146.94 AND 147.045 REPEATERS, AND THE 147.57
*SIMPLEX FREQUENCY and their band of mealy mouthed, back stabbing, two
*faced lying malcontent faggots, decent law abiding amateur radio
*operators in Palm Beach County have begun to take back their clubs and
*airwaves.
*Fed up with the lies and innuendo, which have caused considerable
*division amongst local ham radio operators and Palm Beach County
*Government. A cohesive effort to thwart the efforts of this virulent
*minority has come forward to stem the tide, which is poisoning our hobby
*and causing the PALM BEACH COUNTY government to realize that some of
*their employees are thieves, druggies and liars
*
*Recent elections in the West Pal Beach Amateur Radio Club sent a clear
*message to these STORM TROOPERS of �THE FUHRER� W4SS, MANNY PAPANDREAS
*that their brand of amateur radio guerilla politics and HITLER TYPE
*PRACTICES are welcome in Palm Beach.
*
*The actions of �THE FUHRER� W4SS MANNY PAPANDREAS, AND STORM TROOPERS
*KG4U GRAF T. FUCKENMAIER WD4IUD, WALTER PEACE, AD4PS, DENNIS HAMILTON,
*W2TIA LEO WINTER, W1OB, JAMES DOVER AND K4LES LESLIE FAGGOT CARTE have
*caused the cessation of all traffic nets in the West Palm Beach Area.
*Some of these individuals have done serious damage to the long running
*West Palm Beach Test sessions.
*
*Even Federal governmental agencies are wondering �WHAT GOING ON IN PALM
*BEACH COUNTY�. They look at Frank Haggerman and have him on their list.
*FRANK FOR SOME REASON CANNOT FIGURE WHY THE SECRET SERVICE visited his
*HORSEBARN THAT HE CALLS HOME AND QUESTIONED HIM �WHY DID HE MAKE THREATS
*AGAINST PRESIDENT CLINTON�. But we all know Frank is a good radio ham�HE

*NOT ONLY MAKE TREATS AGAINST THE PRESIDENT BUT HAS BEEN CAUGHT JAMMMING
*ON VARIOUS REPEATERS NUMEROUS TIMES. BY THE WAY FRANK HAS THE INTERNAL
*REVENUE SERVICE SETTLED UP WITH YOU YET?
*
* Keep up the good work Frank, THE FUHRER MANNY W4SS WILL BE PROUD OF
*YOUR NAZI/HITLER TYPE ACTIONS.
*
*After the ARRL disbanded the test team for violations of FCC Part 97
*rules this test team has been able to regroup and continue to operate
*under new management and a liaison that is honest and will not allow the
*unethical games played by the previous NAZI test team to continue.
*KG4U GRAF T. FUCKENMAIER AND AD4PS ARE NO LONGER allowed in the ARRL VE
*program. AD4PS DENNIS HAMILTON WAS KICKED OUT OF THE ARRL VE program
*because of questionable actions during an ARRL test session. Membership
*is all of the major clubs and repeater groups in the area have suffered
*tremendously along with repeater traffic dropping to an all time low.
*Several hams that are currently under the employ of Palm Beach County
*Government and local municipalities have been the targets of
*investigations as a result of their actions such as thievery, ethnic
*slurs, threats against civilians and homosexual actions on county time.
*
*PALM BEACH COUNTY government officials have issued a direct order to
*AD4PS DENNIS HAMILTON, not to use any amateur radio equipment while he
*is on County time as a result of threats made by him to a County
*civilian. Believe it or not AD4PS DENNIS HAMILTON is the R.A.C.E.S.
*officer for PALM BEACH COUNTY. WHAT A DISGRACE TO THE R.A.C.E.S. PROGRAM
*AND TO PALM BEACH COUNTY. KEEP IN MIND THAT �THE FUHRER� W4SS MANNY
*PAPANDREAS IS THE HEAD OF THE PALM BEACH COUNTY EMERGENCY MANAGEMENT
*PROGRAM. This program is now suffering from lack of participation due to
*the action of the NAZI managers of this much-needed emergency program.
*Even the faggot infested Wellington E.O.C. has better participation in
*emergency programs.
* As a result of these actions there has been a resurgence of decent
*amateur radio operators who have vowed to take up the fight against this
*insidious cancer which has plagued the hobby here in West Palm Beach.
*There is currently a loose confederation of hams who have begun to rally
*around this silent majority and move toward regaining control of ham
*radio, and sending forth the message that �THE FUHRER� W4SS MANNY
*PAPANDREAS and his lying band of disgruntled malcontents NAZI
*STORMTROOPERS don�t speak for the rest of us.
*

Kev you gotta get with the program man. Porkbutt is one of the biggest scurges to Ham radio. Take a trip down to alt.radio.amateur.misc and read up on him sometime. Because I lead such a boring life, the postings that some of the guys leave about Porkbutt make for some pretty good entertainment.

*If you're trying to get more than the alternator will provide you will be
*replacing it soon, so just buy another or so now and mount it in advance.
****

Not if they (caps) are discharged sufficiently enough. A fully discharged cap
will appear as a dead short on those diodes.

Yep just take the step response of a RC network and it is real easy to see if a
cap is effective. Now to take the step response one needs to know the initial
voltage, the series resistance of the wire, the source resistance and the load
resistiance as well as the cap value.

real simple.

Yes Echo mics do suck.
Those of us that use the big Galaxy's and know how to set the knobs don't sound bad at all.
I think a radio with the ever so slightest bit of reverb sounds much louder and better. Especially if using a descent mic that isn't a power mic turned up too far.

Just this truck drivin' fools opinion (KEYWORD here OPINION).

Have a GOOD DAY

Jeepers Joe I only made #2. I thought for sure Id be numero uno. Im somewhat disappointed. Tell me, what the hell happened during this post that drove you off of the deep end because I cant seem to find anything THAT bad.

With regards to "Another Stellar Day on the Amateur Airwaves", do you feel that this behavior is appropriate of Ham radio operators or do you feel that because it was I who posted this, that this is Ham hatred? Did you actually read some of the responses? Especially the comment made by the Ham who questioned why someone analogized that type of behavior with CBers? Sometimes the truth hurts.

So, what "other things" need to be done when running power??

Also, I keep hearing that you really need to make sure the antenna is
grounded properly. How is this done with a mag mount? I guess the
grounding point would be where the coax connector hits the back of the
radio. In this case, would the coax shielding provide the ground from
antenna to auto frame?

Dale.

Hey, it works for me!!
If you have a a problem with it, may be you can flash a message to the
FCC on you secret squirrel agent decoder ring. Would you need a liscense
for that??!!!!
The guy asked a simple question about a freakin radio!!! Why do you
ASSUME he's unliscensed and begin enforcing regulations for the FCC????
Why don't you go stand on the interstate and prattle on about the
illegalities and dangers of reckless driving???? Be sure to get in the
hammerlane!!!! And stand still so I don't have to swerve!!!!

Hi,

I just bought a used RCI 2950 and it has talkback in it. The problem is , i don't want talkback in it. The guy i got it from said"the cb guy cut some jumper on the circuit board" . I have looked and can't find it anywhere . Does anyone know where this jumper is suppose to be? Any help would be greatly appreciated!!!!!

Thanks , Doug

Ive never seen anything but those cheap antennas at radio shack. I have 2
whips from a CB shop and right now I have one on the bumper of a 96 chevy
blazer. It looks nice cause i painted it black and it gets great range.

Actually, I prefer public knowledge, no offense. The 76 does not have a direct modification for its PLL IC. Though a collpits oscillator (Expo Kit) will allow for "extra" channels.

I believe now that I think about it, is the A or S kit. Dont know, I just recently looked for another gentleman, but dont have access to non of my service manuals and/or catalogs at the moment. Try Left Coast of Bills-2-Way, and I believe Thomas Distributing carries them. I make my own, so, not sure which one, sorry.

I haven't looked at the schematics yet, but I believe it is D67. You can achieve this by cutting one leg as TRAMD300 mentioned, or just totally remove it, which if the tech does this (which I dont care to participate in) he/she will now have a known working component...get me? Also look on the underside (tracing side) right from a pin on the audio chip might (should) be a .01 micro-farad disk capacitor soldered in series with a resistor (value can vary depending on how much talk back the tech decided to put in it) going to another trace (sorry I would have to be looking at one to know where exactly), this will be the only capacitor-resister series from the audio chip, which is against the side of the radio (10 pin integrated circuit if I remember correctly). Hopefully this help. Oh, yeah, my point is you would want to remove this also.

I will look at my service manual as soon as I get a chance and tell you exactly what type of diode gets cut/removed. Im sure just a general purpose signal diode should work in place of the one removed, but let me make sure.

Hank

I wouldn't pay more than $65.00 for one, and that in itself is high for
where I live.  Try to find a used one if you are going for low buck.  Also,
what model GE radio is it?  Model numbers along with brands always helps us
all out to better help you.  You could have a radio capable of extra
frequencies right from the PLL (Phase Locked Loop) IC (Integrated Circuit).
In a nutshell, it, umm, trying to keep it simple......controls the frequency
your radio is operating on (please other non-newbies, not hate replies, but
its the best simple explanation I could give)...

if you add another 12 volt batt it will require 15 to 30 more amps to keep
this batt charged while in use. if you have a 100 amp alternator, then you
should be able to run about 60 amps of peak current draw without any
problems, meaning you should be able to run a five pill,or some where around

375 rms watts, the only thing adding a shitload of batteries will do is keep your voltage from dropping below "their" voltage, if you to keep your voltage around 13.8 you'll be better off not running a bunch of batteries and let the alternator do its job without trying to replenish a bunch of batteries. On the capacitors, they will keep your headlights from dimming when you modulate and will take some of the inrush load off of your alternator, but you will probably need about 2 farad to keep up with50 or so amps peak current, but you money will be better spent on an alternator or larger wire or something of this nature. when fusing keep the fuse as close to the battery as possible, and size it to fit the current rating on the wire. make sure you have large enough wire coming from the alternator. the factory wire is not enough, and there is a good chance that this may be where your problem may be. the ground must be as big a wire as the hot. depending on the make of the mobile you might need to upgrade the wire bonding the engine block to the chassis, keep in mind that engine is on rubber mounts. just my 2 cents, hope it helps.

GOOD LUCK!
Peak-A-Boo in the star!!!

Your test set-up is poor. If you were really keying at 100
and peaking at 140 you'd sound so muffled that very few people
could tell what you were saying. The real dead-key wattage
out of those amps is in the 50 to 75 range, and the peak wattage
is in the 120 to 200 watt range.

If you don't know the difference between dead-key, average, and
peak wattage, you should read the AM Tutorial on my web site--
it'll clue you in to what the deal is. There's a link to it
below.

I've heard the ham bands in the US are already suffering from interference by many
Part 15
wirelessgadgets. This is primarily on the worldwide bands. Need to clean this
interference up, or
there will
be a lot of static on HF for Amateur radio operators to endure.

The 455 is rated at 60 peak watts with 2 peak watts in at 12.5 volts.(1) That would mean 2 of them would hit 120 peak watts with 4 peak watts in at 12.5 volts under load.

All CB radios deliver more than 4 peak watts into their loads. Almost all linear amplifiers run with an under-load supply voltage of more than 12.5 volts. With all that in mind, it's easy to see why a pair of 455s deliver more than 120 peak watts. You have to understand that amplifier output power is dependant upon input power and supply voltage. In simple terms, the higher the input power and/or supply voltage, the higher the amplifier output. With that in mind, it's easy to see that the output of a CB amp that uses a pair of 455s will be higher than 120 peak watts. In my experience, the typical output from a CB amp that uses a pair of 455s is 150 to 220 peak watts.

(1) Motorola RF Device Data (Rev 4); page 2-653 (see graph).

On Sun, 8 Aug 1999 19:17:07 -0700, "Mr. 137" <ac137@iwvisp.com> wrote:

*Actually, Gary, you and Mr. Lucas are correct but then not totally correct.
*First of all, on paper, CAPs usually provide for initial current draw and

*sustain for a period of time until it reaches its load capacity (voltage
*drop). Then the charging system feeds the CAPs and (depending on what farad
*capacity the CAP holds) the CAPs voltage steadies. Now, when hooked up to a
*keying-type amplifier, it does the same thing. Although the intial surge of
*amperage draw is "helluvalot" more than a commercial audio system, (if the
*vehicle is running) the mobiles charging system will kick in and sustain the
*CAP and battery's charge. Speaking through experience, CAPs is an excellent
*idea for surplus amperage/voltage storage. In all intents and purposes, it
*is a battery but doesn't hold any reserve amperage.
****

For all intent and purposes a cap is not a battery. Never will be!

****
*Why would hi-performance mobile stereo owners put CAPs in-line with their
*amplifiers and batteries if they knew it would drain and not hold any
*voltage/amperage to sufficiently run their stereo system? Usually, sound
*systems are played for hours on end. You rarely see any stereo system
*fanatic turning off their stereo just to charge up the CAPs and/or
*batteries.
****

Audiofiles use them in car systems to ride peaks. Due to the physics of a capacitor, it does not like instantaineous changes in voltage across them. When the voltage across a cap starts to change the cap releases stored energy to try and maintain a constant voltage across it. Caps alone will not solve the problem of voltage sag when the peak current demands of the load are to great for the power source feeding the load, the voltage will still sag. If you are already overstressing the power source, a cap will do little to help. If the power source is at optimal or less, a cap will help in preventing small sags in voltage when large peak currents occur. In audio circuits, the claim is that distortion is incurred when peak currents are seen. Thus the caps help in reducing the distortion. In RF application the line regulation for an amp can handle sags in voltage of up to 5% with little ill effect on the distortion produced from the amp. With audiuofiles wanting less than .1% distortion, they demand that the power source be as constistant as possible. Thus they add caps. For RF they will help in some cases. In most cases they really are a waste of money. If your line voltage sags more than 5% in a mobile situation I suggest that the wire carrying the current be beefed up as to handle the load currents or the power source have sufficient power hanling capabilities.

James

the radio were talking about is a ham rig and not a cb so your argument is valid. by the way who said anybody would be transmitting on the air? you hams always put words in other peoples mouth. why are you so worried about hf anyways since your a high and mighty tech. have fun on 2 meters and leave the hf band to those of us who can handle it, whether its pirates like me or real hams.

I'm about to get a mag-mount antenna and was wondering what the installation of these entails. For example, would I have to scrape the paint away from where I mag-mount it? Would I just run the coax through an open window?

Thanks,
-Robert C.

You can mount the mag mount directly to the paint finish. It would be better if the mount comes with a rubber boot. You will probably have some paint discolloration in any event but it doesn't happen as fast with a rubber boot. You can fish the coax through a door, most cars have a gasget with enough room to not cripm the coax too badly. Through a window is better if you can do it without crimping the coax. If you are going to run power you will need to do some other things. Let me know if I can help further.

Put the sandpaper away! The idea is to NOT scratch the paint. You just don't know how much I wanted to say you should get some #40 rotary disks and take the paint off down to bear metal, but I was good for a change.

Not sure if the number is correct, but in most cases the talkback is achieved by cutting one leg of D-78.
It is located on the right hand side about half way back, about 1 1/2 inches to the left of the audio chip.
I believe it is a clear diode with red in it.
Check to see if this has been cut or remove, if so replace or solder it back in place. This should get rid of the talkback.
Hope this helps...

My 2 cents:

If people enjoy them and like the sound, who cares? I happen to like the sound of clean well-adjusted echo.

The goal of CB'ing, aside from maybe getting driving info, is to have fun; CB'ing is not a particularly efficient method of communication. If my only goal was clear communication, I'd get a ham license or send someone an e-mail, or maybe EVEN CALL THEM ON THE PHONE!.

I think a slightly overmodulated signal with a touch of echo sounds cool as hell. I have bigger complaints about the losers with big base stations hogging up channels 19 and 17 instead of taking their conversations to another channel, they make it difficult for everyone else to communicate, have fun, and get traffic info. As far as I'm concerned, it's sort of the airwaves equivalent of dumping one's garbage in a public park.

For the first time in many years, I did some trucking on the I-5 corridor last week, and I was amazed at the number of loudmouth jerks with big base stations screwing everyone up. These guys really need to make some real friends and get a job, instead of spending all day and night ruining everyone else's fun.

Echo? Who cares?

Do you mean, one more time incorrectly?

: It has long been an ITU regulation that CW is required for a license to operate
: hobby-style radios below 30 MHz. FCC rules must conform to International law.

It is not "International law". It is a set of rules that are agreed to by the
members of the ITU (International Telegraph Union). You must abide by the
rules to be a member.

The FCC and the US is entirely free to ignore those rules if they wished.
The result would that they would probably be ejected from the ITU. This is
not going to happen, as the US WANTS the ITU to have as much force as is
possible in the rest of the world. You can imagine the havoc if every country
decided to set up their own frequency bands. All of a sudden, the Ham and
CB bands might be swamped with the signals from gigawatt religious broadcast
stations during any skip periods.

It is only a 5MHZ audio scope. Not much for trouble shooting or repairs but it can show you your modulation peaks. It only samples a small portion of your audio from the coax line. It isn't real accurate on cb frequencies. It was made to go with the B&K 2040 signal generator and the B&K 1040 service center . The units were built to all go together as an entire set (as well as the B&K frequency counter but I forget the # on it) All the items work well together in this set but the scope is kind of a joke, The weak link in the chain if you will. It will work but isn't to much help in trouble shooting. There are much better scopes that work alot better and have much more potentional as far as repair work on cb equipment is concerned. If you have the entire B&K set you may want to hang onto the scope as a matching piece but actually use a beter one with all the other pieces of equipment . I do have the entire set but do not use the scope. I use a Tektronix 465 which works very nicely with the rest of the B&K test set.

Actually, NOT correct. The SWR has to be the same, everywhere along the length
of the coax.  If this were not true, then you could match your antenna by
changing the coax length.

The readings from simple SWR meters will be different when you vary the place
you perform the measurements - due to the current and voltage nodes that exist
on the coax.

Maybe, if you are willing to accept a VSWR of 5:1 or more at the band edges.
I would not count on more than about 0.5 MHz at a VSWR under 2:1.

Make sure your squelch is not turned up too high - or the volume set too low. If neither of those are the problem, then you need to get the receiver checked out at a good radio shop.

Simple fix, You have a 5 pin mic plug reverse pins 2 and 4. What ever is on pin 2 right now put it on pin 4. What ever is on pin 4 put it on pin 2. One of these pins may have nothing on it. If thats the case then make the other pin have nothing and put the wire on the now vacant pin. It's a very simple fix and a common wireing problem that many people do to that chassie. It will recieve fine but when you turn up the volume, the louder you go the more it will "Howl" back at you making the recieve audio hard to decipher.

They are decent radios provided you don't rely on the rubber ducky
antenna it comes with. If it's just for fun and so forth, don't spend
lots o moolah on trying to get one with SSB. These GE handhelds can be
found at a few places, but the rebateco is the cheapest (long term
anyway).

Search and seizure is search and seizure. It matters not what gov't agency you work for. The constutution makes no provision for exceptions to that rule. Every citizen of this country has the right to certain due process. And I for one will refuse entry to any enforcement officer of any branch of gov't who can't show me in writing that this due process has been followed. IE, a search warrant.

Inspecting my station is very different from entering my home. And it has nothing to do with illegal substances or items as you intimated. That is typical liberal thinking that assumes that just because someone wants and holds dear their privacy they must have something to hide. I for one resent the idea of a gov't agency who DOES NOT answer to the voters having any power to do anything at all. Since Clinton has been in the white house things have gotten worse. I'm sure you've noticed the increase in your phone bill. This is due to a TAX that was levied on the American people without us having a single opportunity to vote on it. It is a tax that was NOT approved by congress which the constitution says must happen for any new taxes to take effect. And what's even worse, part of the FCC's rule that applied that tax stipulates that the long distance carriers can't tell us the real reason why that increase happens. They were forbidden from itemizing it on the bill as an FCC charge and were also prohibited from telling us the truth about the charge if we call them up and ask. This is just an example of what the FCC has become. And I will do everything within my constitutional rights to hinder them in any way I can. Even if the only thing I can do is make them get a search warrant before entering my house.

No law superscedes the constitution. At least that's what the founding fathers of this country intended. Unfortunately, decades of liberal rule has brainwashed the people of this country into thinking that the gov't has the power. That's what is so terrible. No one rules without the consent of the people. That's why liberals are so determined to disarm and otherwise rob the people of their individual liberties. They know that the people of this country will never sit still and allow them to go much further. So they are trying to disarm us to make sure we can't fight back when they come to our homes and take our property, for thier own needs, try to silence our ideas, and other things that criminal despots like Clinton tend to be involved in. I wouldn't be the least bit surprised come 1/1/2000 to learn that Clinton has used the so called y2k crisis to declare a national emergency. That will allow FEMA to take over the gov't and suspend constitutional gov't ensuring that Clinton never leaves the white house. That's the only thing that will allow him to keep that which he most desires. Power.

QRM responds:
Care to explain why I'm wrong, Bill?

INTERNATIONAL RADIO REGULATIONS
Article 32--Amateur Service and Amateur-Satellite Service

Section I. Amateur Service
Paragraph Three, (1)

"Any person seeking a license to operate the apparatus of an amateur station shall prove that he is able to send correctly by hand and to receive correctly by ear texts in Morse code signals. The administrations concerned may, however, waive this requirement in the case of stations making use exclusively of frequencies above 30 MHz."

Source: International Telecommunications Union

>The FCC and the US is entirely free to ignore those rules if they wished.

ARTICLE 32--AMATEUR SERVICE AND AMATEUR-SATELLITE SERVICE

Paragraph 5(1)

"All the general rules of the Convention and of the Regulations shall apply to amateur stations...."

Bill says:
>The result would that they would probably be ejected from the ITU.

BINGO.

Bill says:
> the US WANTS the ITU to have as much force as is
>possible

Another BINGO. I see Mr. Nelson DOES understand the concept at work here.

Bottom line:
Morse code proficiency is required for frequencies below 30 MHz because of an ITU regulation. Someone asked about this earlier in the thread, and that is still the answer. Mr. Nelson can play "lawyer" all he wants, but the facts don't change.

Until amended, International Rules require code proficiency for amateur station applicants, but individual governments can waive this for licenses which allow operation ONLY above 30 MHz. The United States exercised this option several years ago with a special license category.

IN CONCLUSION:
That which I posted was a sincere effort to provide concise, accurate information without turning this into a boring legal piece with more details than anyone wanted or needed. That's as far as I wish to go with this. However, I agree with Mr. Nelson concerning the havoc that would result if international cooperation and agreements were suspended.

To start with, you posted it late, Stan. And you put it in the wrong NewsGroup. I was gonna ask you to do something similar for me, but you appear to be quite unreliable. (grin).

I am sure that, like the National Enquirer, you checked and re-checked your facts before publishing this.

But I am curious about one thing. Do you often volunteer to do other people's "dirty work"? I might have some "death threat" work I can refer in your direction--if you promise not to put the job off until the target is 95 years old!

QRM

PS: Have a good vacation. We really enjoyed your post card that said:
"Weather is here; wish you were fine." That was SO cute!

Dear Fellows:

I would like to get instruction manual for RCI-2950. I lost
myself when I moved for a new house!
I will pay for xerox copies is avaliable. And, shipping
to Brazil.
Please, reply to my e-mail address below.
Thanks in advance!
Vy 73,

I paid $74.00 for one here in NC. They have them at Copper Electronics for $59.00. Check it out

http://www.copper.com/online/box.cgi?name=W30-05004&add=Add+To+Order

I have also used the K-40 Mag Mount. It is also a good antenna but I like the Wilson better. Both have an adapter on the connector so you do not have to run the big PL259 connector during the install. Both allow for easy removal of the coil/whip from the mag mount base. The Wilson also comes with a cap to install on the exposed base threads.

Be careful buying any used antenna. Be certain that you can adjust for a good SWR before you give any money. Sometimes the coil can be damaged and not completely open. Either of these antennas should be tunable for an SWR below 1.5 on channel 20.

The K-40 seems to be better on the lower channels and the Wilson on the higher channels (SWR).

I usually dont use the Spell check because the machine (software) loves to make suggestions which I prefer not to use and I prefer using My own words to convey a sentiment. In addition, not using spell check is more like the "written word" thus "Let the mistakes fall where they may".

As far as grammatical content is concerned, inconsistencies and missing words are usually what happens when I get involved in something else during a post, and then come back to that post for completion. Life in the 90's...................no time to smell the roses.

it is d80 it is located behind the filter from the power input from 12
volt you can see it on the right side of the radio in the rear just to
the right of the audio amp that is mounted on the side of chassis

For what? TNT sure makes poor fertilizer unless you're growing popping corn (yuk, yuk). Actually I use more Ammonium Phosphate but the Nitrate provides much more Nitrogen and faster initial growth.

at the rear doesn't really matter

I just stick with 1/2 wave mults everywhere and the 24 feet makes plumbing a longnose an easier approach

If you are running something in the rear then

I would go 12ft to driver 3,6,9,ft to box then 12 feet to rear hot or shorter

there are also different lenghts you can play with between the hots

I might be wrong in my set up,

if so someone HELP

Greetings!

I'm about to pick up an older Radio Shack CB handheld, the TRC-236, and was wondering if anyone had any experience with it, or knew of where I could obtain a review. Any feedback on this radio would be very much appreciated!

In this electronic world, you are what you write. If someone is to be taken seriously, they need to be able to convey their ideas so that the reader doesn't have to work too hard at reading it. Everyone is entitled to an occasional typo, but some of the guys here display their level of education every time they hit a key, and it often appears to have ended in the third grade. I do use the spell checker but hit the Ignore button alot, and more importantly, I read what I typed before I hit the Send key.

Wildcat wrote:

listen up folk's the fcc is going to rewrite the test to be taken to get your ham ticket. 1st of all you must live in a mobile home in a bad trailer park.
2nd you must be as stupid as a retard
3rd. you must post all of your cry baby thought's in a newsgroup.
4th. you must have completed at least 6 years of school.
5th you must no how to bitch and complain about others.
6th. you must no how to preach to others about all the right's and wrong's others do that is none of your business
7th the real good one , you must no how to complain to the fcc and the arrl about what other's are doing and not what you are doing god for bid you are the best.
8th   you must be completly brain dead.and have to be forse feed.
9th you must have had a ham ticket in the past 10 years in order to get the new ticket
10 th why don't you ham's go get a real life and leave everyone else alone, oh i for got you are a bunch of ass whips allready.
i think we should all go to your newsgroups and bitch about the way you guy's are talking and the selling of amps to none ticket holders
also you punk's need to look in the mirror and your own back yard to.
so if any one of you ham boy's post to this thread you must have the need to redeem yourself.
so let this whole thing dye and go back where you came from.
people are tired of it now. and you don't want to start a war you will not be able to finish.

have a good one people

What difference does it make if you refuse the FCC and they come in your
home and see the drug, they still have no right to do anything about it. If
the FCC even gets a warrant it will only be for illegal radio equipment
they have no right to even get a warrant for anything else.

Sounds to me like you are the one always "starting" things. This is the third....maybe fourth...inflamatory anti-ham thread you've tried to start in the past 30 days.

I will agree with you on one point. People ARE tired of this #%$&. They came here to talk about CB--not to sit around and bash hams.

Besides, it seems to me that this would not be a good business move for somebody who sells CB and Ham radio equipment (as you claim to do). A lot of CBers are hams--including a growing number of truckers. You think they are gonna give up the CB gear, just because you think a ham license is like having some kind of disease? Think again. They use the CB as part of their job, and they're gonna keep it.

They also talk among themselves. How much of your customer base can you afford to have ticked off by your attitude?

Yes, people are tired of this bashing. That's why you no longer see the 250-post threads like you used to be able to start. The folks here are wise to what you are trying to do, Mr. WildcatRadio.

I picked up a old Teaberry Stalker Two for a couple of bucks at a yard sale. It only transmits on lsb. I opened it up and one wire from the selector switch (orange), and onother (grey) from the board has been disconnected from the board.

There is now a small orange wire ? the one cut on the board with a 2k resistor between it and another wire where it looks like the grey cut wire went. There has also been a channel mod done. Does anyone know how or where I can get the info to correct what what done so i can see if I can get this rig working.

Thanks

I hardwired and mounted a volt meter to the top of the amp. It shows a
constant voltage reading (so long as the possitive and negative leads
are connected to a power source). So the only point at which I have
taken a reading is at the amp.

Depends on what you mean by bandwidth. Typically this means Freq vs SWR. It
could also mean FREQ vs gain or FREQ vs FB ratio. Typically the freq vs gain
bandwidth for a yagi is about twice as wide as the freq vs swr. This being the
case you could use a tuner with your setup and easily cover 1Mhz  with good
performance of the system.

i go shoot photos deep in remote mountain areas....a recent event with wildlife has prompted my interest in some kind of communication with the outside world, should something happen.

i was hoping someone could recommend a radio that has the power and range i may need... yet will cost me less that a couple hundred bucks?

any input will help, but specific models may help in my online purchase. also..if someone could recommend an online store...... that would help too.

thanks....lewis

Quote the poetry correctly at least.

Self-Pity

I never saw a wild thing
sorry for itself.
A small bird will drop frozen dead from a bough
without ever having felt sorry for itself.

D. H. Lawrence

The poem was used in the movie G. I. Jane.

Now go troll somewhere else.

Thats the problem..... VERY FEW people have a clue how to adjust there echo.... MOST of the idiots over do it and sound like shit.

And as far as BIG BASES on Channel 19 ... How about the asshole truck drivers that run 1000 watts to talk truck to truck with there squelch all the way up so the do not hear the local traffic that they are bothering ??   There is a lot more of them then big bases on 19 !!   They're almost as bad as those skip niggers that bleed all 40 channels...then youfind out they are 10 states away !!

MY 2 Cents worth !

I had a 6 AWG wire going from my LARGE fuse block to my amp. (7')
I lost 3/4 of a volt from one end to the other. Replaced wire with
a 4 AWG lead. Voltage stays the same on both ends now. I will be
upgrading grounds and power leads. Killed my old alternator last
week and I was surprised that the main feed wire from my alt. is
only 10 AWG. Two feet of that to my battery. Cleaned every connection
including the mount points and got rid of about 1/4 ohm of resistance.
(that's 12 amps more current capacity)

```

Could you possibly learn how to spell:
no = know
forse = force
dye = die

Capitals belong at the beginning of a sentence. A period belongs at the end of a sentence. Be consistent in your punctuation. It makes your posts easier to read.

Pick the proper homonym:
there - their - they're
your - you're

(Sorry. I is a high school graduate :-) (a sentence you mite understand)
(misteaks on porpoise)

We are fixin to make a trip in the wifes car, so before mounting my new uniden 510xl in my truck, I got a cigarette plug adapter from radio shack and a wilson 1000 magnetic antenna and just kinda temporarily hooked everything up in the car. I notice that if there is no real signal coming in and the squel is down, I get engine noise out my radio. Is this normal or is it because I am pulling power from the cigarette lighter ? I've heard that if you pull the power from the same line as the car sterio, you get some noise filtering...is that true ?   Thanks. (had it on coming into work this morning, so far it seems like a pretty good little radio).

If you feel I was condemning you personally because you are too stupid
to use the
spell check, and enjoy typing crap that nobody can easily read and has
even less
chance of being communicative, you're right for a change. Wildcat, for a
businessman, you are about the dumbest thing I have ever seen.

You should look in to the Cobra line. I' ve had a Cobra 25 LTD for about ten
years and have had no problems with it. The radio sells for around $89.00.
These radios are very basic but they are great talkers. Bills -2way or the
Coaxkid sell them. Some of the guys out here can give you there web site.

anyone farmiliar with Midland "DELUXE" 40 channel am\ssb base. Model number is 78-999. Just wondering if these are good and what one might be worth. I know someone who has one forsale with original paperwork, box etc.

Thanks

Jeff

You have connected to a central point for the electricity but you are
also going to pick up any noise generated by other components. For a
temporary situation you can live with it, but when you install the radio
permanently, wire it directly to the battery, both positive and negtive,
and fuse both wires under the hood. It will make a world of difference.

Lewis,

I go 4 wheeling a bit and I always find that the CB is helpful. However, we are currently in a sun spot cycle and it is only getting worse, this means a lot of noise during the daylight hours. Sometimes the noise is bad on into the night. Range can be limited to a few miles, however someone 3000 miles may hear you.

Anyway, I highly recommend a CB but I would also consider a cellular phone if you have service available in the remote areas you mentioned.

Maybe someone can help.. I have a TRC-474 that has been lying around for a while. I put it in my truck recently, and for a while it worked.

The other day it quit transmitting though. The modulation light doesn't come on or anything, but the led's work for recieve strength. If the final tramsistor (2sc2166 on this) went, would the mod light come on? I could replace it & see if it works. What is the unides equivalent of this unit? The board is marked Uniden, PA-206AB - is this a model they made? Are there any mods for this unit? Someone suggested replacing the 2166 with a 3133 for more power, but the power is fine already. Anything else?

Later..

Oh, okay, you were making fun of the hams who complain about CB folks.
Gotcha.
Well, you know what they say, if you've got half a mind to use a CB, that's all you need!
Me, I'm underqualified, only got a quarter left. :)

My dummy load is not giving a very low SWR, about 1.2. I can actually get
my antenna down further to 1.1. Question is, is it ok to use the dummy
load to tune a radio even if the SWR is not that low?

I have a Grant XL on a power supply and DOSY 4002 meter...

Thanks,
-Robert C.

DO NOT DEAL WITH ROB LONG (a.k.a. drgn@antigopro.net) !!!!

You will subject your self to much grief if you do !!

He has a very bad reputation of trying and succeeding in Ripping folks of
here on the newsgroups!!

He is from Pearson, Wisconsin.

Yes, the Postal Inspector does have actions pending on Mr.LONG.

1. Galaxy DX-949 with channel board, peaked, ready to go.
Roger beep, swr, power meter, talkback, all built in. Comes
with all original accessories, i.e. stock mic, box, bracket,
box, power cable, etc. $100 shipped. 22 watts out on SSB

2. Ranger RG-99, mint condition, used little. With D-104 M6B
mic, and all original accessories. $150 shipped. The mic alone
is worth 40 bucks, also has the FC-390 external counter, [will
not sell the counter seperately.] 45 watts out on SSB.

3. Uniden Pro-810 40 channel SSB base station. Very clean condition
$90 shipped. 20 watts out on SSB.

All these radios are in excellent cosmetic condition as well as
excellent working condition. Must sell so that I can purchase my
new radio.

Buckaroo,
It was a great night last night. I tried hollering for ya many times. I talked to new york ,Penn.,Miss.,Neb. and ILL. But I couldn't get ahold of you.

>If you don't like the way things are, work to change it or leave.

No need to tell me that. I do all that I can everyday to try to make /keep things as good as possible. Mainly in education of people. It is sad that most never know a law is even being cosidered until it goes into effect and they read about it in the paper or hear it on TV.
This country is not really like the people want it. The legislators sneak a lot by citizens.

>>> In Brooklyn, Ohio; it is against the law unless it is an emergency.
>>> They just recently passed this law

Also.... if a law as this ever goes into effect in my area I will have to be childish but...
I will have about 20 toy look alike plastic cny hodling cell phones all over each of my autos. When I see a cop I will look like I am having a big time conversation on one while driving perfectly fine.
It will be kind of funny. A big waste of time and tax money right? Thats what a law like this is. A big farse and waste of time, energy, brain cells.

"Take the time to realize what it is you believe in;

Spend a little more time describing the problem to where we could make sense of it all please. So far its sounds likes the rotary switch or a pull resistor. In layman's terms.

Most drop seems to be in the wire running + to the amp. Don't forget a good ground. Resistance there is worse because it can lead to ground loops. Current will flow through shields and other places it shouldn't.

After seeing the newsgroup change from a help group to a chastise the CB'er newsgroup i decided to do some research.

I organized all the posts by author. Then i read the posts and tried to discern an agenda. That agenda being to put down CB'ers or the service as it exist today. I then came to a list of authors who obviously enjoy putting down CB'ers or the existing service at any opportunity. These authors in my opinion do more harm with their self righteous behavior than good. Therefore i present the kill file list for anyone to use as the real cleansing agent that this group is in dire need of. Here it is.

explorer@voyager.org says...
> So why do they allow phone on 27Mhz without a license? Because of low
> output power?

I think you're correct. Below 5 watts. If I'm not mistaken,
Japan has a service below 30MHz with phone. It is also 5 watts,
or less.

the radio has been hooked up backwards.   if you didn't do it then it was
not a new radio but had been installed before....   send it back.

There is over 75 % of the cbers that wish that they could get their setups
to an actual honest 1.2 .
So I would complain at all.

rcvd my first shipment of the new radio "Delta Force" today....did a close
inspection and it appears to be a cross between the Cherokee 1000 and the
North Star series....has some of both in it....seems to work great.   real

good filtering..... sug. retail is 329.95 Made by Magnum. hmmmmm, wonder if Wireless has formed a new company.

The meter is inaccurate, and it's best if you make wattage measurements using a dummy load rather than an antenna. Any SWR (reflected power) at all tends to skew wattage readings. Your test set-up is showing the dead-key too high and the peak too low.

Again, if you can find some time, read the AM Tutorial on my website; it goes into all of this in detail.

The AWI light is a antenna warning indicator. it tells you that there is
something wrong in your antenna system. sounds like you need to get it
checked out before you have damage.

Hello RHOOLIGAN2: One of the problems not mentioned here is with the watt meters. Like on a Bird model 43, like when the 1000 watt slug is installed, and the meter movement gets pegged without the amp or transmitter being totally tuned up, what ya do?

U cAN buy a new 2500 watt slug, but then you would want to pin it again. And that would require more pills, then a few more alternators, or another 3CX800A7, right!

So what do ya do? Will I learned on the ng here, that you could carefully pull the slug out de-sensing the full meter reading, allowing the transmitter or amplifier to be tuned for max. Ain't this great!

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station. Miss Dinah down the road at the fillin station, has two brand new Bird 2500H slugs fer $99.98 American dollars. But ain't no one never bought one.But she did sell the new 3CX800A7, go figure!

Brass, If you are trying to achieve the 2 Hot antenna system better known as
the "End Fire" array which will concentrate your signal in one direction
you will need 12' of coax, the 66% velocity factor type to the front antenna
and 6' of coax to the back antenna, this can then be run into a tee with any
length coax you need to reach its final destination. The antenna element
spacing is on the order of 1/8 wave or 1/4 wave, 6' or 9'

Do you know what a "truth chart" is? If so, get one for that
radio and start checking the programming pin logic against it.
You'll find that there's a short or an open in one of the
programming pin circuits. The reason for the short or open
could be a bad channel selector switch, a broken wire, a
botched mod, a cold solder joint, etc.

A service manual or Sams Photofacts for that radio will have
a truth chart in it. Sams Photofacts are available for free
lending and/or photocopying at many public libraries.

Okay. This most certainly sounds like the channel selector as aforementioned. Either that, or it is a pull resistor. Though, I would look at the selector first if it were on my bench. Still dont have a brand/model to work with... <grin> But, try retacking the solder joints on the PCB (for the channel selector rotary switch). Let us know how you made out.

Dave,

Sound like he already has damage.. <grin> Hmmm.. Well Greg, as Dave mentioned this is the (A)ntenna (W)arning (I)ndicator, which DOES signify unusual high VSWR. Therefore, as Dave mentioned you most certainly do have a problem in the antenna system. Though, I have seen these go on, when the antenna was fine, but the pre-driver transistor burnt. I would recommend taking it to a tech.. Unless you have some electronics experience (not just measuring voltage)...   Let me give it some thought, and if something new pops in my head, I'll post again... unless replied to.

When speaking of antennas, you're right. When speaking of dummy loads, you're wrong. A dummy load is almost worthless if it doesn't present the *exact* resistance that the radio is designed to load into under ideal conditions. If a dummy load shows a 1.2:1 SWR, chances are it's been overheated to the point where it's resistance has permanently increased. That means it's ruined as far as being part of a highly accurate test set-up. To verify, simply measure the dummy load's cold DC resistance. A 1.2:1 SWR means the cold resistance is likely to be around 60 ohms rather than 50.

In my 20 years in the hobby I've ruined a few dummy loads. It comes with the territory. Just suck it up and buy (or build) another, bigger one.

To answer the original author's question; yes you can still use the damaged dummy load to tune the radio. Just keep in mind that the wattage readings will be somewhat skewed. Given that you're using a Dosy, that doesn't really matter. Just tune for maximum wattmeter needle deflection with modulation and disregard the actual wattage reading.

As far as the generator (transmitter or amplifier) is

concerned, it is. If you want to play, we can get into
that more later.

> it is the same all along the coax (disregarding
> minor coax losses). No multiple is 1/2 wavelength coax is required.
> Listen to tnom@muck.net. Stop farting with coax length.

You didn't thoroughly read tnom's post. He accounts
for the fact that the "system" (coax and antenna combined)
SWR does change (if the line is not flat) with coax length,
and that certain transmitters (especially those with less
than unconditionally stable amplifiers) will react differently
to the load presented to them based on changing coax lengths.

In any case, I'm glad to see you posting again. Perhaps
we can get back into some of our old, lengthly (and painful)
debates over things like amplifier biasing. :-) I've
learned a few things over the last year or so that should
make my arguments even harder for you to stifle.

73.

This could be a fairly accurate reading, as some galaxy radios will key real
high as aposed to a say 29 ltd. about half of these amps I have seen or
heard about would only swing about 150 peak on am.

You're just one asshole--your pissed-off generalization
about my website is meaningless--it just shows how big
a baby you are.

Maybe when you get over your temper-tantrum you'll visit
my site and learn the answers to your questions. It's
not my fault you bought an inaccurate meter and that you
don't know how to put together an accurate test set-up.

Last I heard, the SS225s were using SD1446 transistors. Even with
weak radios they'll peak in the 180 to 225+ range as long as the
DC supply voltage is adequate.

In any case, my original statement applies. Using a proper test
set-up (a powered, peak-reading meter or a scope and a dummy load),
if you were to key at 100 and peak at 140 you'd sound so muffled/
pinched/crispy/sizzly that all you'd hear are complaints. If
that's not the case, the only logical conclusion is that the
wattage readings are inaccurate. You have to maintain at least
a 2:1 peak to carrier ratio to sound decent. In this case that's
dead-keying at 100 and peaking at 200, or peaking at 140 and
dead-keying at 70. Keying at 100 and peaking at 140 is a peak
to carrier ratio of 1.4:1--that's so low that there will be very
high levels of audible distortion in the signal--so much so that
some people won't even be able to figure out what's being said.

Oops, I knew I should have said something..   I tried two different
mic's.. The first has been on it in my Jeep, bouncing around for the
last few months. I tried the other one & it didn't work either.. I
have it out now & with a speaker hooked up to the PA jack the mic does
work.
Does the 422 have the AWI (I think that is what it says) indicator?
What does it do? Mine always lights up, indicating a problem?

Thanks again
  Greg

So why do they allow phone on 27Mhz without a license? Because of low
output power?

Sounds kinda contradictory to me...

Better method you might wanna try: get piece of 5" OD PVC pipe and saw off a 14" section. Carefully close-wind 300 turns of #2 insulated copper wire onto it. Solder one end to a copper pipe approximately 30" long and leave the other end bare. Now get a 50 gallon drum and fill it halfway with pickle water (Be sure to use Kosher pickles, Jay) and about 5 lbs. of iron filings. Center a piece of good quality cardboard on the outside wall of the 50 gallon drum and tape it in place with duct tape. Drive the copper pipe down into the iron filings so it stands up straight in the pickle water (holding the coil).

Now attach your coax center lead to the copper pipe. Attach the braid to a bare metal spot on the outside wall of the 50 gallon drum. Now take a pen and write "50 gazillion watts" (or whatever you want) on the cardboard. Sure, it's accurate. Just like the "slug-desensed Bird" is. Have fun.

I don't know if anyone remembers my earlier post but I have some more questions. I also know this might stir things up so I'm wearing my Nomex. Ok I finally picked a radio, and I need an antenna. I know the bigger the antenna the better, but I'm not really looking for extreme range. I don't want a large antenna, and I don't want a magnetic antenna, I kinda just want it to work decent. I was leaning more towards glassmount or AM/FM/CB. I like the idea of using my existing AM/FM. It's a 3ft antenna and it receives very well for the radio. I found the adapter to use any AM/FM for CB, it's made by Valor, and it has connectors, and a matching adjustment on it. Now I heard from a guy in the biz that using an antenna adapter like this burns up CBs. Is this true or false? Also I found a few glass mount antennae from several manufacturers. Most of these come with a way to match the antenna, cables, and connectors. I found one that was a "true half-wave" 10/11 meter antenna from Solarcon, and others from name brand manufacturers. Given these two choices which is the better of the two? One would be placed at the rear right corner, the other would be fairly centered, and highest point. Any insight would be appreciated.

O jeez.........god help me.

I read and read and read...............postings.about those "lousy ham's", and "Those lousy Cb'er's
Geez............get a life people!

Here's the facts.

There are always undesirable people in both groups. some of the amateurs that hang out here are often despised by their peers............so they come down here to "impress" the CB'ers. conversely, some of the CB'er's post back.telling them off........THIS IS EXACTLY WHAT THEY WANT.

These "hams" do not represent the hobby at all.......they are not the mainstream, so don't throw them all in one basket There are some really nice and helpful amateurs out there, who deal everyday with assholes like this .

Remember the potty mouthed CB'er who likes to start trouble and throw carriers? Consider the trouble making ham of the same cut. He is just as much an embarrassment to the amateur community as well. They won't tolerate his actions, so he just wants to take it out on CB'ers.

To those few trouble making hams I would say this: If you think all CB'ers are sh**t......what are you doing here? Has your peers made you feel unwelcome on the amateur bands? Wonder why? I would not tolerate a Marxist attitude on any frequency!

CB'ers, don't flame these trouble makers, greet them with silence, just like their peers do. Fact is, radio theory is the same if it's on 80 meters or 11...........nothing to crow about. .

This "brother better than you" attitude has caused Ham radio to drastically

loose numbers. when the old guys die out, who will carry the torch? The ARRL
is not much help.........they are throwing out the baby with the bath water,

Cheers
Andy

heheh.... Dude, If you don't see the possibility of such a thing going =
down then you're blind. Here are the facts:

The FCC (among many other such agencies) doesn't answer to the voters.
Clinton and his administration have used them to levy taxes on us =
without our consent or even the opportunity to object and then tried to =
hide it from us by forbidding the phone companies from telling us why =
our phone bill went up.
If Clinton (or someone like him) ever does decide to put a limit on our =
means of communication the FCC will be the way it's done. Just like the =
BATF (another federal agency that doesn't answer to the voters) is the =
primary means of oppressing gun owners.
Clinton recently signed into law an executive order increasing the power =
of federal agencies like the FCC, BATF, FBI, FEMA, etc by giving them =
the authority to ignore state and local laws if they deem necessary. =

This executive order even gives them the authority to MAKE LAWS when =
state or local law doesn't allow them to do what they want.
Since 1952, conservatives (both republican and the rare conservative =
democrat) have tried to pass an amendment to our constitution that would =
spell out clearly and in writing that no law, treaty, or other activity =
on the part of the federal gov't could superscede the constitution. =
Such an amendment would protect for all time the bill of rights and =
other sections of the constitution that are constantly falling under =
attack by liberals. Every time this amendment has come up liberals have =
philabustered, attached unacceptable riders, and engaged in other low =
tactics to prevent the amendment from passing.
Clinton has signed more executive orders than any other president in the =
history of this country. He repeatedly circumvents the will of the =
people with these executive orders by using them to make laws that he =
either failed to get congress to sign off on or knows up front that =
congress will never pass.

Here's an excerpt from an article about this executive order:
<quote>
Last year I wrote an essay on EO 13083. You can click here if you want =
to review it.=20

Bill Clinton set off afire storm when he signed it in May 1998. The =
order gave government agencies greater power to establish rules and =
regulations without requiring that pesky Congress to approve them. These =
rules and regulations would override and supercede all state and local =
laws and regulations. EO 13083 died when governors, mayors, and =
intelligent individuals raised absolute hell. Clinton suspended the =
order shortly after the National Governors Association expressed its =
opposition.=20

Well, it seems EO 13083 is not dead after all. David Bresnahan of =
WorldNetDaily reports that there is a new, revised EO on the table. =
Clinton signed the order yesterday. It is titled" Federalism" and has =
not yet been assigned a number. Clinton claims that state and local =
government representatives helped him to revise it. The new version is =
slightly more palatable than EO 13083, but there are still some =
Mack-truck-sized loopholes that allow federal agencies to do whatever =
they please. Pretty sneaky. The first time this came up, talk radio and =
the Internet were instrumental in spreading the word to the public. =
Fifteen months ago we learned that Bill Clinton was willing to sneak EO =
13083 past the American people to expand his own power base. Should we =
be surprised that he's trying again with a more polished version? It may =
look better, but it still stinks. Clinton's hoping again that you'll be =
too distracted to care. As Clinton aide Paul Begala said of Executive =
Orders; "Stroke of the pen, law of the land. Kinda cool." The new EO =
takes effect on November 4, 1999. Get that dialing finger ready and call =
your representatives in Congress.
<end quote>

These and other attacks on the Constitution and the limitations it =
places on the power of the federal gov't must be stopped. Already, if =
congress doesn't act immediately (and it's real convenient that Clinton =

```
signed this new order while Congress was on vacation) Clinton will have =
all the power he needs to enact the FEMA scenario that I mentioned in =
the previous post.

Yeah Rhooligan, go ahead and keep your nose buried in those comic books. =
 Ignore the tactics of the Clinton whitehouse and see how long it takes =
this country to become the newest dictatorship on the block.

The problem with EPIRBs and their lower-tech ELT brethren is that the satellite system doesn't notify AFRCC until two passes...so this device has to be activatedfor a good hour or two before anybody will even begin to THINK about starting to look for you.

If cell phone service is available in the area, that would be one way to go. If it isn't, then satellite equipment would have to be considered. Yes, it's expensive, but if your life depends on it, any price is worth paying.

I also wouldn't even think of going out in bear country without a suitable firearm that is capable of dropping a bear if the need arises. I imagine a rifle wouldn't be too handy what with having to carry photographic equipment already as it is, but a good .44 Special or preferably .44 Magnum will stop a bear if used with some competency...assuming local law allows carrying same. If not, that rifle might just be worth the bother.

I just found the old Comstat 25B and tried looking for a antenna.
I found every omnidirectional out there looks like half wave vertical
dipole's whets going on ?
Even Radio Shack doesn't sell a 4.75 dB 5/8 colinear with the radials
anymore.

Do not go with a glass mount. I have tried several (even ones that can have the swr tuned) and NONE work as well as an antenna mounted on metal. I would suggest a short 2' fiberglass whip (Wilson silver load) and either a trunk mount or roof mount. If you keep the car in a garage, a trunk mount or the roof mount on the trunk).

Well put. And this has been a malady for many years now.

I love it!.........Especially the Marxist part. However there are those
Hams who are here because they legitimately enjoy CBing. You can tell who
these individuals are by reading their posts.

>Fact is, radio theory is the same if it's on 80 meters or
> 11...........nothing to crow about. .

Wow, Tempola you should be sitting high on a mountain in Tibet with robes
on. Its like you are the Mr. Miaggi of 11 meters.............Mic
on.......Mic off. Great insight. While I usually take the aggressive line,
you put the issue into terms that even Hemingway would love.

I dug out my old Radio Shack TRS-455 40-channel 5-watt base unit last week
and bought one of those back-of-the-set antennas from Radio Shack. I'm
afraid to key the thing up -- with that antenna, am I going to interfere
with the neighborhood TV sets? Will my CB blow up? Am I going to tap into
some secret government channel and have black helicopters landing on my
roof? It seems to be receiving just fine. Especially when the skip is in.
It's been over ten years since I ran this thing, and I could swear that same
guy down in Oklahoma has been yawping about how good he gets out for the
whole ten years...

Seriously, can I expect to spread interference with the back-of-the-set
antenna? I need to know, some of my neighbors own assault rifles. :)

HOLY SMOKES!!!
SOMEONE SEES LIFE THE SAME WAY AS I DO.
DOES THAT SOUND SELF CENTERED???
IT MIGHT, BUT IT ISN'T MENT TO BE.
I PRIDE MY SELF ON MY VIEW OF FAIRNESS AND JUSTICE.
I DON'T LOOK DOWN ON ANY GROUP, RACE,RELIGION OR ANY OTHER CLASS OF PEOPLE
BECAUSE OF A FEW OR JUST ONE IS AN IDIOT.
BUT ON THE OTHER HAND, IT MAKES MY BLOOD BOIL WHEN A GROUP OF PEOPLE, (CB'ERS)
ARE CLASSIFIED AS DUMMY'S BECAUSE WE DON'T POSESS A HAM TICKET.
I AGREE THERE ARE SOME OF OUR BENT THAT USE HIGH POWER AND EITHER DON'T KNOW
HOW TO USE IT RIGHT OR DON'T KNOW HOW TO MAINTAIN IT IN CLEAN WORKING ORDER.
HAVING A HAM TICKET IS LIKE HAVING A MARRIAGE LICENCE, IF YOU LOVE WHO OR WHAT
YOU'RE DOING TO INVEST YOUR TIME AND MONEY TO LEARN ABOUT YOUR OTHER PERSON OR
HOBBY, WHO NEEDS A PIECE OF PAPER.
ALL THE ONES THAT ARE JUST SCREWING AROUND WILL GET TIRED OF IT OR BUSTED
EVENTUALLY.
JEFF

Well I don't, but I do come down here to read the silly posts and get a good laugh. Reading the posts on this news group is more funny than many of the comic strips in the local news paper. CB isn't called the "Children's Band" for nothing you know.

check the audio output transformer or the anti-spike diode next to it.
if it is either, you loose modulation.
if it is the diode, it is next to the transformer. replace it with a 1 amp @
50v or higher part.
look at the bottom of the circuit board for a trace that connects a black diode
to one leg of the transformer, (both are on top). replace it with the same
polarity as the old one if it's bad.
as for freq mods, if it's the one i'm thinking of, i think it has a uPD-2824c p
l l.
if so, you can get an expo-100 kit for it.

if i'm wrong and it has a tc-9106 p l l, there's no freq mod for it.
good luck.
jeff

Yes, on AM you can tell when someone unkeys because you lose the carrier, but on SSB it can be difficult to tell when someone unkeys. It helps prevent doubling.

yes i wrote that but it wasnt my question. i know the answers and i didnt find
them in a radio shack study guide either. 73 tim

ps. how come almost every ham that comes to this cb board is only a lowly tech?
seems to me there not thru with 11 meters yet. i guess they cant get away from
the fun.

Have old Teaberry "T" Control base unit from 1977. I have lost the original
manual.
Xerox copies are fine. Acrobat3 Adobe files O.K. also.
Willing to compensate.

Thanks for your responses.

I'm delighted that you kept someone in a job by squandering money on 'big ass fuses' and gold plating. You still didn't get the point that you can have voltage loss going through the buss, and the shortest distance to the source of power is by going directly to the battery itself with as short and as large of a multistranded wire as possible.

Local Author would like to interview any Caucasian who owns a CB radio and has been on food stamps, received welfare, received disability for a fake injury; anyone who rents a home-on-wheels, who owns a car or truck worth less than 1,000 dollars, who has few or no teeth, who has a GED, who drives a truck, bus, or trolley for money, who beats his wife sporadically, who can't hold a steady job, who is over 40 and has never been on an airplane, who has relatives busted for drug or alcohol related offenses, or any and all of the above.

Will pay money to find out what the life of the White Trash American on CB Radio is all about, e.g.; How to avoid payment of social security taxes, how to cheat the IRS, how to get arrested for DUI or Drug related offenses, how to have babies out of wedlock, etc.

Submissions and stories will be included in a new book entitled:

White Trash in America: CB Radio as a Way of Life

Subjects who submit to interview will receive a coupon for a new Cobra 2,000, or a new set of false-teeth, their choice.

The AWI has always come on, no matter what antenna I tried it on.  It
used to be on a fiberglass whip on a loong cable run (with a few
splices) so then I figured something was wrong.  It was used
infrequently so I didn't worry about it.   Right now it is hooked up to
a mag-mount, and it was used a few times with a RS set back antenna when
the old one was ripped off.
I do have a bit of electrical experience, but right now don't have
access to most of the equipment. (Electrical Engineering Tech. student,
labs are shut for the summer)

Thanks again
  Greg

It may be faster just to retac all of the solder joints then to first, figure out binary, etc, etc.. That why I keep repeating for him to tell us the brand/model. Then I could narrow it done, as well as many of other people...

Hank
